TABLE OF CONTENTS	2
INTRODUCTION	4
TRM CHANGE LOG	10
APPLIANCES	29
Refrigerator (Inactive) (RF)	30
Freezer (Inactive)	31
ROOM AIR PURIFIER (RAP) (INACTIVE)	32
Dehumidifier (DH) (Inactive)	34
DISHWASHER (DW) (INACTIVE)	36
CLOTHES WASHER (CW)	38
WATER HEATING AND WATER USE	41
LOW-FLOW KITCHEN AERATOR (LFKA, LILFKA)	
Low-flow Bathroom Aerator (LFBA, LILFBA)	44
Low-flow Showerhead (LFSH)	46
THERMOSTATIC SHOWER VALVE WITH LOW-FLOW SHOWERHEAD (TSV, LILFSH, LILHSH, LILWSH)	48
HEAT PUMP WATER HEATER (HPWHM, HPWHD, HPWHI, HPWHB)	50
HEAT PUMP WATER HEATER DIRECT INSTALL (LIHPWH)	
Domestic Water Heater Temperature Turn-Down (Inactive)	54
Domestic Water Heater Pipe Insulation (Inactive)	
Domestic Water Heater Wrap (Inactive)	57
TANKLESS WATER HEATER (NGWH, TLWH) (INACTIVE)	59
SPACE HEATING AND COOLING AND RELATED EQUIPMENT	61
DUCTLESS HEAT PUMP RESIDENTIAL LOST OPPORTUNITY (CH, HPSING1T1, HPSING2T1, HPSING1T2, HP	NG2T2, HPMULT2T1, HPMULT1T1,
HPMULT1T2, HPMULT2T2)	
DUCTLESS HEAT PUMP RESIDENTIAL RETROFIT (HPSING1T2, HPSING2T2, HPMULT1T2, HPMULT2T2)	
DUCTLESS HEAT PUMP LOW INCOME RETROFIT (LCHA, LCHL, LCHD)	
WHOLE HOME HEAT PUMP (AIWHHPR, LIWHHPR, MIWHHPR)	
MANUFACTURED HOME WHOLE HOME HEAT PUMP (MHWHHP)	
FURNACES AND BOILERS (BOILM, FURNM) (INACTIVE)	
Furnace and Boiler Retrofit (Inactive)	
LOW-INCOME GAS HEAT (MODELED)	
PELLET/CORD WOOD BOILER (APB)	
CENTRAL AIR-SOURCE HEAT PUMP (DUCTED) (DHA) (INACTIVE)	
CENTRAL GEOTHERMAL (GROUND SOURCE) HEAT PUMP (GCL, GOL, GHP)	
ELECTRONICALLY COMMUTATED MOTOR: HYDRONIC HEATING SMART CIRCULATION PUMP (ECMHW)	
ROOM AIR CONDITIONER (RAC) (INACTIVE)	
SMART THERMOSTAT (STSTAT, LTSTAT)	
PELLET/WOOD STOVE (CPS, CWS)	
DUCT INSULATION (DDI, LUB) (INACTIVE)	
DUCT SEALING (DDS, LUB) (INACTIVE)	
HYDRONIC HEATING PIPE INSULATION (DPI, LUB) (INACTIVE)	
SEAL/INSULATE PIPES/DUCTS (LUB) (INACTIVE)	95
TRANSPORTATION	97
FLECTRIC VEHICLE (REV. PHEV. LREV. LPHEV. MREV. MPHEV. CREV. CPHEV.)	98

DEMAND MANAGEMENT	100
Curtailment – 1 Year (DR1)	101
ELECTRIC VEHICLE MANAGED CHARGING (BEVMCP, PHEVMCP)	
SMALL BATTERY MANAGEMENT (SBATR, SBATC)	103
OFF-PEAK CHARGER (OPCR, OPCC)	
BUILDING THERMAL ENVELOPE	105
AIR SEALING (IR, LIR, MIR)	106
AIR SEALING DIRECT INSTALL (LNAS) (INACTIVE)	108
Insulation (BA, LBA, BB, LBB, BW, LBW, BU, LBU, MBU)	
Insulate Attic Openings (LUB) (Inactive)	112
WINDOW INSERTS (LWI)	114
APPENDIX A: GLOSSARY	116
APPENDIX B: COINCIDENCE AND ENERGY PERIOD FACTORS	120
APPENDIX C: CARBON DIOXIDE EMISSION FACTORS	125
APPENDIX D: RETAIL LIGHTING EISA HISTORY	127
APPENDIX E: STANDARD ASSUMPTIONS FOR MAINE	130
APPENDIX F: SUPPLEMENTARY INFORMATION FOR RETAIL PRODUCTS	134
APPENDIX G: BASELINING CALCULATION METHODOLOGY FOR DEMAND RESPONSE MEASURES	139

#### **PURPOSE**

The Efficiency Maine Trust Retail/Residential, Commercial/Industrial and Multifamily Technical Reference Manuals (TRMs) provide documentation for the Trust's calculation of energy and demand savings from energy-efficiency measures. Each TRM serves as a central repository and common point of reference for the methods, formulas, assumptions and sources that are used to estimate savings from energy-efficiency measures, and provides a common platform for analyzing energy savings across measures and programs. The importance of the TRM is derived from the importance of energy and demand savings calculations, which are at the foundation of the Trust's program planning and management, cost-effectiveness analysis, program evaluation, Annual Report and Independent System Operator – New England (ISO-NE) Forward Capacity Market (FCM) participation.

### **GENERAL FORMAT**

The TRM is organized by program area and then by measure category, which may include one or more measures. Each measure category is presented in its own section as a measure characterization, following a standard format. The measure characterization includes a measure overview, energy and demand savings algorithms, baseline assumptions, deemed parameter values or instructions for inputs to savings algorithms, measure life and measure costs and impact factors for calculating adjusted gross savings and net savings. When there is a set of common values across measures, summary tables are provided at the end of the relevant section or in an appendix.

Where deemed savings values are specified, Efficiency Maine Trust (the Trust or EMT) uses integer values when reporting in units of kWh, three decimal places when reporting in units of MMBtu, and three decimal places for all demand (kW) values.

#### **GUIDANCE & COMMON ASSUMPTIONS**

In using the Trust's TRMs, it is helpful to note the following:

- **Gross savings:** Algorithms are specified for *gross* savings. To calculate *adjusted gross* savings or *net* savings, impact factors that account for verified measure performance (adjusted gross) and attribution (net) must be applied. The formulas used to calculate adjusted gross and net savings are described below.
- **Annual savings:** Algorithms are specified for *annual* savings. Unless otherwise noted, annual savings are assumed to be realized for each year of the measure life.
- *Unit savings:* Algorithms are specified for *per unit savings*. The Trust's program databases track and record the number of units of a given measure delivered through the program.
- *Meter-level savings:* Savings are assumed to be the savings that occur at the customer's meter (or point of use for non-electric savings); line losses are not included in these calculations.
- Non-electric savings: When applicable, savings are counted for natural gas, oil, propane, kerosene, wood and/or
  water. The deemed unit savings, algorithms and assumptions for these non-electric impacts are described in the
  measure characterizations whenever those savings are counted. If a non-electric impact is not described for a
  measure, it can be assumed that no non-electric impacts are counted for that measure.

- In-Service Rate (ISR): The in-service rate represents the percentage of program units that are installed or implemented. Unless otherwise stated in the measure-specific sections of this TRM, the ISR is set to 100 percent for the following reasons:
  - In the commercial sector, it is uncommon for customers to purchase equipment and not immediately install or use it.
  - The Trust's non-retail programs include some level of verification of the measure purchase and/or installation. These verification procedures ensure that projects and savings are counted only for measures that are implemented.
  - The effects of non-implemented units may be identified in the program impact evaluation and accounted for in the energy and demand realization rates.
  - Direct install measures result in 100 percent installation rates.
- Coincidence Factors (CF): Coincidence factors are provided for the summer and winter on-peak periods as
  defined by the ISO-New England for the Forward Capacity Market (FCM), and are calculated in accordance with
  the FCM methodology. Electric demand reduction during the ISO New England peak periods is defined as
  follows:
  - Summer on-peak: average demand reduction from 1:00 to 5:00 PM on non-holiday weekdays in June,
     July and August
  - Winter on-peak: average demand reduction from 5:00 to 7:00 PM on non-holiday weekdays in December and January
- **Life:** Life refers to the effective useful life of the measure. It represents the equivalent number of years the savings are expected to be realized. Lifetime savings = annual savings x life. Measure life takes one or more of the following aspects into consideration: 1) projected equipment life, 2) documented equipment warranty, 3) measure persistence<sup>1</sup>, and 4) savings persistence<sup>2</sup>. Life is set to represent a conservative estimate of the aggregate life of all measures of that type installed and not the characterization of the life of a single, specific installed measure.
- **Deemed savings value vs. deemed savings algorithm:** For some measures, deemed savings values are provided representing the estimated average savings per unit for the measure. The deemed savings value may be based directly on the results from an evaluation or other research study, or may be based on a set of deemed input parameters applied to the stated energy and demand savings algorithms.
  - For other measures, deemed values are provided for only some of the parameters in the algorithm and actual values for a given measure are required to calculate savings. In these cases, project-specific (or "Actual") data recorded in the relevant program tracking database is used in combination with the TRM deemed parameters to compute savings.
- Project-specific ("actual") data for parameter inputs: The savings methods for some measures specify "actual" data for at least one of the input parameters. Actual data refers to values that are specific to the project. Unless

<sup>&</sup>lt;sup>1</sup> Measure persistence is a quantification of how long the measure will remain in place. Causes of reduced measure persistence include any activity that removes the measure or eliminates the savings such as equipment upgrade, refurbishment or renovation of the building, closure of a business, or override of efficiency controls.

<sup>&</sup>lt;sup>2</sup> Savings persistence is a quantification of how long the defined savings will remain. Causes of reduced savings persistence include a change to the baseline over the useful life of the measure so that future savings are less than first-year savings and changes in usage behavior over time.

otherwise stated, these actual project data should be collected and documented on the project application forms. For some measures, the TRM provides alternative values if the actual data are unknown.

- Data sources for deemed parameter inputs: Wherever possible, deemed parameter values and assumptions are based on Maine-specific research and data. When such data are not available, the TRM relies on relevant data sources from other areas within the U.S.; in doing so, data sources from neighboring states and regions are prioritized. In some cases, engineering judgment and scaling for regional differences are used.
- **Decision type:** The decision type describes the underlying scenario that is assumed for the savings calculation of a given measure. The decision type has implications for the baseline efficiency case and the measure cost assumptions as shown below.<sup>3</sup> For each energy-efficiency measure, the TRM identifies the relevant decision type, or types, corresponding to the scenarios in which the given measure may be implemented.

Decision Type	Scenario	Baseline	Measure Cost
New Construction	Customer is in the market to purchase new equipment for a new construction or new capacity project or as part of a planned renovation or to add controls to improve the performance of new equipment	Federal standards or standard market practice for new equipment	Incremental cost: difference between the cost of baseline and cost of high-efficiency equipment
Replace on Burnout	Customer is in the market to purchase new equipment to replace existing equipment that has worn out or otherwise needs replacing	Federal standards or standard market practice for new equipment	Incremental cost: difference between the cost of baseline and cost of high-efficiency equipment
Retrofit	Customer's existing equipment is in working order and has remaining useful life or customer is adding controls to improve the performance of operating equipment in an existing facility.	Existing equipment or conditions	Full measure cost: cost of the high-efficiency equipment (including installation)

- Efficiency standards: The TRM anticipates the effects of changes in efficiency standards for some measures, including shifts in the baseline for CFL and LED bulbs due to changes in Federal Standards for lighting products under the Energy Independence & Security Act of 2007 (EISA).
- **TRM updates:** The TRMs are reviewed and updated annually, or more frequently if needed, to reflect new information obtained through research and evaluation studies, changes in program offerings (measures) and shifts in technology and baselines. Annual updates to the TRM are published as a new "version" (Version YYYY.1) with a specific effective date. Inter-year updates to the TRM are published as iterations to the version year (Version YYYY.x) with changes and effective date indicated.

<sup>&</sup>lt;sup>3</sup> Table adapted from National Action Plan for Energy Efficiency (2008). Understanding Cost-Effectiveness of Energy Efficiency Programs: Best Practices, Technical Methods, and Emerging Issues for Policy-Makers. Energy and Environmental Economics, Inc. and Regulatory Assistance Project. https://www.epa.gov/sites/production/files/2015-08/documents/napee\_report.pdf

#### **SAVINGS FORMULAS**

The formulas and inputs used to calculate the deemed gross annual energy ( $\Delta kWh/yr$  (electricity) and  $\Delta MMBtu/yr$  (natural gas and other fuels)) and gross max demand ( $\Delta kW$ ) savings for each measure are described in the measure sections. The formulas used to calculate adjusted gross savings, on-peak demand savings, and lifetime savings are described below. For measures that have different gross max demand savings for winter and summer, max heating ( $\Delta kW_H$ ) and max cooling ( $\Delta kW_C$ ) demand savings are reported. For measures where coincident demand reductions are estimated directly, winter ( $\Delta kW_W$ ) and summer peak ( $\Delta kW_S$ ) demand savings are reported and the coincidence factors set to 100 percent.

# **Adjusted Gross Savings**

Adjusted gross savings represent the total energy and demand savings achieved by measures implemented through the Trust's programs. The adjusted gross savings values are calculated by applying various evaluation parameters to the gross annual energy and demand savings:

Adjusted Gross Annual kWh =  $\Delta$ kWh/yr × ISR × RR<sub>E</sub>

Adjusted Gross Lifetime kWh =  $\Delta$ kWh/yr × ISR × RR<sub>E</sub> × Measure Life

Adjusted Gross Annual MMBtu<sup>4</sup> =  $\Delta$ MMBtu/yr × ISR × RR<sub>E</sub>

Adjusted Gross Lifetime MMBtu<sup>4</sup> =  $\Delta$ MMBtu/yr × ISR × RR<sub>E</sub> × Measure Life

Adjusted Gross Summer On-Peak kW =  $\Delta$ kW × ISR × RR<sub>D</sub> × CF<sub>S</sub>

Adjusted Gross Winter On-Peak kW =  $\Delta$ kW × ISR × RR<sub>D</sub> × CF<sub>W</sub>

The Adjusted Gross Summer On-Peak kW value is equivalent to the Demand Reduction Value reported to the ISO-NE Forward Capacity Market.

## **Net Savings**

Net Savings represent the total realized energy and demand savings that are attributable to the Trust's programs. These net savings are calculated by applying the net-to-gross (NTG) factors such as free-ridership (FR) and spillover (SO) to the adjusted gross savings.

Net Annual kWh =  $\Delta$ kWh/yr × ISR × RR<sub>E</sub> × (1 – FR + SO)

Net Lifetime kWh =  $\Delta$ kWh/yr × ISR × RR<sub>E</sub> × (1 – FR + SO) × Measure Life

Net Summer On-Peak kW =  $\Delta$ kW × ISR × RR<sub>D</sub> × CF<sub>S</sub> × (1 – FR + SO)

Net Winter On-Peak kW =  $\triangle$ kW × ISR × RR<sub>D</sub> × CF<sub>W</sub> × (1 – FR + SO)

Note the parameter (1 - FR + SO) may be replaced with the net-to-gross (NTG) ratio.

<sup>&</sup>lt;sup>4</sup> In this document and other reporting documents, fossil fuel savings are reporting in unit of MMBtu. In the tracking data base (effRT), natural gas savings are calculated in units of therms and then must be converted to MMBtu.

#### **SAVINGS CALCULATIONS**

The actual calculation of energy-efficiency savings, pursuant to the algorithms and assumptions documented in the TRM, occurs in the Trust's program tracking databases. In 2012, the Trust initiated a significant effort to upgrade and transform its existing program-specific databases into a comprehensive, unified database system that supports multiple programs with standardized internal processes, features and quality. This initiative builds on the foundation of the successful Efficiency Maine Reporting and Tracking (effRT) database system that historically supported the Business Programs to create a new multi-program database system, effRT 2.0. As part of this effort, the Trust is mapping the TRM deemed values and algorithms into effRT, and establishing processes for updates to effRT to coincide with TRM updates.

As of January 1, 2014, the Trust added adjustment factors for the in-service rate (ISR) and the evaluated realization rate (RR) to the formulas used to calculate the demand reduction value (DRV) for Forward Capacity Market (FCM) monthly reporting. Results using these two additional factors are referred to as *Adjusted Gross Savings* in the effRT report.

Change Type	TRM Section	Description	Effective Date	effRT update
PY2014 Add	dendum			
Revision	Table B-1: Coincidence Factors and Energy Period Factors	Added coincidence and energy period factors for the new ductless heat pump and ductless heat pump retrofit measures to existing Table	11/12/2013	Y
New	Ductless Heat Pump	New measure section for Ductless Heat Pump	11/12/2013	N
Revision	CFL Bulb, LED Bulb	-Updated savings algorithm and savings values to account for evaluation findings indicating a share of retail lighting program measures being used in commercial settings	7/1/2013	Y
PY2015 Upo	1			
Revision	CFL Bulb, LED Bulb	-Updated savings to include new EISA update for PY2015	7/1/2014	Υ
Revision	Refrigerator, Freezer, Dehumidifier	-Updated energy and demand savings based on new evaluation results and a baseline adjustment -Updated Coincidence Factors to be consistent with updated peak demand savings -Updated free ridership (FR) and spillover (SO) using new evaluation results	7/1/2014	Y
Revision	Room Air Conditioner	-Updated energy and demand savings using a new baseline condition accounting for new code standard -Updated FR and SO using new evaluation results	7/1/2014	Y
Revision	Room Air Purifier	-Updated FR and SO using new evaluation results	7/1/2014	Υ
Revision	Clothes Washer, Dishwasher	-Updated distribution of water heater fuels based on new evaluation results -Updated FR and SO using new evaluation results (the values for the dishwasher measure were based on overall program weighted average)	7/1/2014	Y
Revision	effRT schedules (Appliance Rebate and Retail Lighting Programs)	Savings, Pricing and Factor schedules in effRT updated to reflect 2014 TRM values and formulas	7/1/2014	Υ
Revision	High-efficiency Electric Water Heater	Temperature setpoint of the water heater was updated based on recent evaluation results	7/1/2014	Y
Revision	Heat Pump Water Heater	-Updated savings based on a Heat Pump Water Heaters Field Evaluation report -Updated FR and SO using new evaluation results	7/1/2014	Y

Change Type	TRM Section	Description	Effective Date	effRT update
Revision	Table B-1: Coincidence Factors	-Updated Coincidence Factors for the following measures: CFL Bulb, LED Bulb, Refrigerator, Freezer, Dehumidifier, Clothes Washer, Heat Pump Water Heater -Added Coincidence Factors for all newly added measures	7/1/2014	Y
Revision	Table B-1: Energy Period Factors	-Updated Energy Period Factors for the following measures: CFL Bulb, LED Bulb, Refrigerator, Freezer, Dehumidifier, Clothes Washer, Heat Pump Water Heater -Added Energy Period Factors for all newly added measures	7/1/2014	Y
Revision	Ductless Heat Pump	Energy/demand impacts, description of methodology, coincidence factors, and energy period factors for the Ductless Heat Pump measure (added to the TRM as a PY2014 addendum) were updated based on a revised savings model	7/1/2014	N
New	Direct Install CFL Bulb	New measure section for Direct Install CFL in Low-income Program	7/1/2014	N
New	Ductless Heat Pump Retrofit	New measure section for Ductless Heat Pump Retrofit in Low-income Program	7/1/2014	N
New	Low-income Multifamily Gas Heat, Furnaces and Boilers, Furnace and Boiler Retrofit	New measure sections for heating measures: Low-income Multifamily Gas Heat, Furnaces and Boilers, Furnace and Boiler Retrofit	7/1/2014	N
New	Home Energy Savings Program	New measure sections for the following measures: Custom Path, Air Sealing, Attic/Roof Insulation, Wall Insulation, Basement Insulation, High-Efficiency Furnaces/Boilers, Furnace and Boiler Retrofit, Pellet/Wood Stove, Pellet Boiler, Central Air-Source Heat Pump (Ducted), Central Geothermal (Ground Source) Heat Pump, On-Demand Natural Gas Water Heater	7/1/2014	N
Removal	Advanced Power Strip	This measure was discontinued, and the TRM entry was removed accordingly	7/1/2014	Υ
Revision	Ductless Heat Pump Retrofit	Updated measure life, updated measure cost	9/27/2014	N
Revision	Central Geothermal (Ground Source) Heat Pump	Changed baseline to Oil Boiler	9/27/2014	N
Revision	CFL Bulb, LED Bulb, CFL Direct Install	Adjusted measure life to 5 years	7/1/2014	Y

Change Type	TRM Section	Description	Effective Date	effRT update
New	Heat Pump Water Heater Direct Install	New measure section for Heat Pump Water Heater Direct Install in Low- income Program	1/1/2015	Y
Revision	Low-flow Kitchen Aerator, Low-flow Showerhead, CFL Direct Install, Ductless Heat Pump Retrofit	Measure costs updated to reflect program costs under the direct install program	3/1/2015	Y
Revision	Ductless Heat Pump Retrofit	Updated savings to account for fuel distribution	3/1/2015	Υ
Other	Low-income Multifamily Gas Heat	Added Replace on Burnout decision type	3/1/2015	N
New	Distributor Lighting LED	Added distributor LED measure	1/1/2015	Y
Revision	High-Efficiency Furnaces and Boilers	Adjusted measure cost based on program data	7/1/2014	Y
Revision	Wood and Pellet Stoves	Adjusted savings estimates to account for outdoor make up air kit efficiency	7/1/2014	Υ
PY2016 Upo	lates			
Other	Introduction	Expanded description of in-service rate; revised deemed savings value vs. deemed savings algorithm, data sources for deemed parameter inputs, decision type and TRM updates descriptions to make them applicable and consistent across all TRMs		N
Revision	CFL Retail, LED Retail, LED Distributor, CFL Direct Install	Updated to incorporate evaluation results	7/1/2015	Y
Revision	Refrigerator, Freezer, Room Air Conditioner	Updated to reflect latest ENERGY STAR® calculator	7/1/2015	Y
Revision	Clothes Washer	Updated to reflect new federal standard	7/1/2015	N
New	Retail: Low-flow Kitchen Aerator, Low-flow Bathroom Aerator, Low-flow Showerhead	Added measures to retail section	7/1/2015	N
New	Thermostatic Shower Valve	Added to retail and low-income sections	7/1/2015	N
Revision	High-efficiency Electric Water Heater	Updated to reflect updated federal standard effective 4/16/2015	7/1/2015	N

Change Type	TRM Section	Description	Effective Date	effRT update
Revision	Heat Pump Water Heater	Updated incremental measure cost based on rising cost of conventional electric resistance water heaters due to new federal standards	7/1/2015	Y
Revision	Air Sealing, Attic/Roof Insulation, Wall Insulation, Basement Insulation	Revised savings estimates based on temperature bin analysis using TMY3 data	7/1/2015	Y
Revision	Ductless Heat Pump, Ductless Heat Pump Retrofit	Updated to reflect refined assumptions and modeling	7/1/2015	Y
Other	Low-income Gas Heat	Removed multifamily designation and added modeled	7/1/2015	N
Other	Furnace and Boiler Retrofit (Prescriptive)	Clarified that measure is prescriptive	7/1/2015	N
Revision	Low-income: Low- flow Kitchen Aerator, Low-flow Bathroom Aerator, Low-flow Showerhead	Updated savings estimates to reflect heat pump water heat energy recovery factor	7/1/2015	Y
Revision	Appendix B	Updated coincidence factors and energy period factors for new and modified measures	7/1/2015	Y
Revision	Multiple	Updated MMBtu per kWh conversion factor from 0.003413 to 0.003412	7/1/2015	Υ
Other	Appendix: Carbon Dioxide Emission Factors	Added carbon dioxide emission factors table	7/1/2015	N
New	CFL – Food Bank	Added new entry for CFL Food Bank measure	7/1/2015	Υ
Other	Appendix: Coincidence and Energy Period Factors	Corrected footnotes	7/1/2015	N
Revision	Retail Products	Added Commercial Sector to Dehumidifier, Room Air Purifier, Clothes Washer and Heat Pump Water Heater – no savings adjustments at this time	7/1/2015	N
Revision	Distributor Lighting	Adjusted deemed savings to account for higher efficacy program requirement	7/1/2015	Y
New	Value-line LED	Added value-line LEDs for retail and distributor	1/1/2015	Y
Revision	CFL & LED	Made several corrections/refinements to CFL and LED entries	7/1/2015	Y
Revision	Pellet Boiler	Added Cord Wood Boilers	3/1/2016	Υ

Change Type	TRM Section	Description	Effective Date	effRT update
Revision	Low-flow Devices	Minor corrections to calculations	7/1/2015	Υ
Revision	On-Demand Natural Gas Water Heater	Updated efficiency, water use and cost assumptions	3/1/2016	Υ
Revision	CFL and LED	Corrected avoided O&M estimates to properly account for delay of first purchase; corrected demand savings to apply cooling interactive demand factor to summer peak only	1/1/2016	Y
New	LED – Food Pantry & Appliance Packs	New entry for LED Food Pantry & Appliance Packs	3/1/2016	Υ
Revision	Low-flow Kitchen Aerator & Low- flow Showerhead	Added Appliance Pack impact factors to Low-flow Kitchen Aerator and Low-flow Showerhead entries	3/1/2016	Y
Other	Introduction: Savings Formulas	Updated description to clarify demand savings terms	3/1/2016	N
PY2017 Upo	-			
Revision	All	Default FR for measures not yet evaluated changed from 0% to 25%.	7/1/2016	Y
Revision	CFL measures	Removed retail CFL measure, food pantry CFL retained to allow for "sell through" of existing inventory until LEDs are available in August 2016	7/1/2016	Y
Revision	LED measures	LED measures split into separate entries for standard and specialty bulbs. Savings estimates updated on FY16 bulb mix	7/1/2016	Y
Other	Various	Marked measures not currently offered as inactive. Inactive measures were not reviewed for revisions.	7/1/2016	Υ
Correction	Refrigerator	Removed RATIO <sub>BASE</sub> which was an inadvertent holdover from a previous version	N/A	N
Revision	Dehumidifier	Parameters updated based on PY16 sales data and revised ENERGY STAR® standard	7/1/2016	Y
Correction	Dehumidifier	Winter coincidence factor set to 0%	N/A	N
Removal	High-efficiency Electric Resistance Water Heater	New federal standards has made high- efficiency electric resistance water heater the baseline	7/1/2016	Y
Revision	Room Air Purifier	CADR updated based on PY16 sales data	7/1/2016	Υ
Revision	Heat Pump Water Heater	Retail and Low-income HPWH savings estimates adjusted for energy factors reflecting current program models and federal minimum standard	7/1/2016	Y
Revision	Heat Pump Water Heater	Updated measure life to reflect NREL, National Residential Efficiency Measure Database	7/1/2016	Y
Correction	Clothes Washer	Calculation correction made to energy savings	7/1/2016	Y

Change Type	TRM Section	Description	Effective Date	effRT update
Revision	Clothes Washer	Demand savings algorithm employed to allow calculation based on new efficiency values; evaluation results used to derive coincidence factors	7/1/2016	Y
Revision	Clothes Washer	Measure cost updated per ENERGY STAR®	7/1/2016	Y
Revision	Home Energy Savings Program	Baseline and energy-efficient measure assumptions updated based on most recent program data	7/1/2016	Y
Revision	Home Energy Savings Program	Fuel savings presented for known and unknown heating fuel type	7/1/2016	Y
New	Attic/Roof Insulation Natural Gas	Separate measure added for attic/roof insulation installed in homes heated with natural gas due to different baseline eligibility	7/1/2016	Y
Revision	Attic/Roof Insulation All Fuels	Natural gas removed from fuel distribution	7/1/2016	Y
Revision	Insulation measures	Separate free-ridership rate added for Low-income Home Energy Savings Program (AHI)	7/1/2016	Y
New	Home Energy Savings Program	Added new measures for mobile home underbelly insulation, insulate attic openings, duct insulation, duct sealing and hydronic heating pipe insulation	7/1/2016	Y
Revision	Ductless Heat Pump	Added savings for multi-head and multiple unit projects	7/1/2016	Y
Revision	High-Efficiency Furnaces and Boilers	Deemed measure cost updated based on data provided in Vermont and Illinois TRMs; separate baseline efficiencies, efficient efficiencies and savings presented by fuel type and equipment type; efficient equipment efficiencies updated based on recent program data	7/1/2016	Y
Revision	Pellet/Cord Wood Boiler	Baseline fuel mix assumption updated; updated annual heat load based on Residential Baseline Study	7/1/2016	Y
Revision	Central Heat Pumps	Savings algorithm updated to use annual heat and cooling loads from Residential Baseline Study; coincidence factors corrected	7/1/2016	Y
New	Air Sealing and Attic Insulation Direct Install	New measures added to low-income section (retroactive to July 1, 2015)	7/1/2015	Y
Revision	Furnace Boiler Retrofit	Savings algorithm updated to use annual heat loads from Residential Baseline Study, transitioned to actual for baseline and efficient-energy factors	7/1/2016	Y
Revision	Low-flow Devices	Measure life adjusted to reflect National Renewable Energy Laboratory's National Residential Efficiency Measure Database	7/1/2016	Y

Change Type	TRM Section	Description	Effective Date	effRT update
Revision	Ductless Heat Pump Retrofit	Savings updated to remove assumed fuel distribution; Savings will be allocated based on actual fuel type; Added parameters used in modeling that were not previously included; Modified efficient measure assumption to reflect program requirements; No impact on savings estimates.	7/1/2016	Y
Revision	Low-flow Devices  – low-income only	Savings adjusted for revised water heater energy factors	7/1/2016	Υ
Other	Appendix Retail Lighting Assumptions and EISA	Appendix renamed to Retail Lighting EISA History. This appendix is being maintained for historical reference only.	7/1/2016	N
Other	Appendix Standard Assumptions for Maine	Updated appendix to reflect baseline assumptions used in TRM entries for boilers and furnaces	7/1/2016	N
Other	Appendix Carbon Dioxide Emission Factors	Updated to current US Energy Information Administration (EIA) factors	7/1/2016	N
Revision	Ductless Heat Pump	Clarified unit definition to allow up to two units per dwelling	9/14/2016	Υ
New	Seal/Insulate Pipe/Ducts	New measure based on weighted average of duct insulation, duct sealing and hydronic heating pipe insulation	7/1/2016	Y
Revision	LED (Retail and Distributor)	Updated measure costs, split specialty bulbs into more refined categories.	11/21/2016	Υ
Revision	Heat Pump Water Heater	Updated measure cost based on price survey	11/21/2016	Υ
Revision	Retail Products: Thermostatic Shower Valve	Decision type changed to retrofit. In Service Rate estimate updated based on customer survey data. Measure cost updated based on program actuals.	11/21/2016	Y
Revision	Room Air Purifier	Measure cost updated based on shelf survey	11/21/2016	Υ
Revision	LED Standard Food Pantry, Direct Install, & Opt-in Mailed DIY Kit	Added 100 W sub measure	12/1/2016	Y
Revision	LED Specialty Food Pantry, Direct Install, & Opt-in Mailed DIY Kit	New measure for specialty bulbs	1/1/2017	Y
Revision	LED (Retail and Distributor)	Updated measure cost	2/1/2017	Υ

Change Type	TRM Section	Description	Effective Date	effRT update
Revision	On-Demand Natural Gas Water Heater	Revised assumptions and savings based on new program eligibility criteria	3/1/2017	Y
Revision	Central Geothermal (Ground Source) Heat Pump	Revised measure cost based on updated assumed baseline cost	3/1/2017	Y
Revision	Low Income Heat Pump Water Heater	Scaling factors updated for current COP and assumed water use	4/1/2017	Υ
Revision	Heat Pump Water Heater	Scaling factors updated for participating models	5/1/2017	Y
Revision	LED (Retail and Distributor)	Updated measure cost	5/1/2017	Υ
Other	LED (all)	Removed reference to ENERGY STAR®	4/1/2017	N
Other	Glossary	Updated RR definition to distinguish between RR <sub>E</sub> and RR <sub>D</sub>	4/1/2017	N
PY2018 Upc	lates			
Revision	LED (AII)	Updated measure costs and delta watts based on program data analysis, revised FR based on pricing trial, updated interactive effects, updated savings estimates accordingly	7/1/2017	Y
Other	Consumer Products Low Flow Devices	Added note about application of ERWH % in effRT when water heat type is unknown.	7/1/2015	N
Revision	LFKA, LFBA, TSV	Updated measure cost to be actual cost. Changed LFKA to Retrofit. Added HPWH savings for direct install. Updated HPWH savings to reflect 3.5 COP.	7/1/2017	Y
Revision	Low Income Low Flow Devices	Combined with Consumer Products measures and clarified different savings for HPWH and ERWH.	7/1/2017	Y
Other	All Measures	Updated/added effRT measure codes for all measures	7/1/2017	N
Revision	HPWH	Updated measure cost based on program data analysis	7/1/2017	Y
Other	Glossary	Added definitions for interactive effects and waste heat factor	7/1/2017	N
Other	Appendix F	Updated bulb replacement schedule, added derivation of interactive effects, added price elasticity FR estimation formula	7/1/2017	N
Other	Retail Products	Renamed to Consumer Products	7/1/2017	N
Correction	Clothes Washer	Corrected %E <sub>DHW_B</sub> and %E <sub>DHW_EE</sub> values that were inverted. (retroactive to 7/1/2016)	7/1/2016	Υ
Revision	Clothes Washer	Updated measure cost based on most recent program data	10/1/2017	Υ

Change Type	TRM Section	Description	Effective Date	effRT update
Revision	Distributor LEDs	Updated measure costs based on most recent program data	10/1/2017	Y
Revision	Distributor LEDs	Updated FR and SO to reflect findings from BIP Evaluation	10/1/2017	Y
New	Distributor LEDs	Added Linear LED and Mogul based LEDs	10/1/2017	Υ
New	Appendix B	Added Commercial Interior and Exterior Lighting factors	10/1/2017	Υ
Revision	LEDs	Updated measure costs based on most recent program data	10/1/2017	Υ
Revision	Heat Pump Water Heater	Measure cost update based on shelf survey performed Aug 2017	10/1/2017	Υ
Revision	Heat Pump Water Heater	Measure cost update based on program data and shelf survey performed Nov 2017	1/1/2018	Y
Revision	LEDs	Updated measure costs based on most recent program data	1/1/2018	Y
Revision	LED and Appendix F	Updated free ridership rate estimate description and corrected free ridership rate values	1/1/2018	Υ
Revision	LED, Appendix F	Refined derivation of interactive effects	4/1/2018	Υ
Revision	LED	Updated measure cost and free ridership rate	4/1/2018	Y
Revision	Low-Flow Devices	Added non-electric savings	4/1/2018	Υ
Revision	Smart Thermostat	Updated WiFi thermostat to Energy Star savings for Smart thermostats	4/1/2018	Υ
Revision	Wood/Pellet Stove	Updated baseline and efficient assumptions and measure cost	4/1/2018	Υ
Revision	Central Air Source Heat Pump	Updated baseline assumptions to reflect current federal minimum standards	4/1/2018	Υ
Other	Heat Pump Water Heater	Refined parameter names, savings descriptions and added definitions	4/1/2018	N
Other	Appendix E	Refined precision of Distribution of Heating Fuel for Maine Residential Customers (added tenths of percent)	4/1/2018	N
Other	On-Demand Natural Gas Water Heater	Corrected end use to Domestic Hot Water	4/1/2018	N
PY2019 Up	dates			
Revision	LEDs	Updated measure costs based on most recent program data, updated free ridership rates, updated avoided replacement costs, updated dual baseline assumptions for bulbs subject to EISA	7/1/2018	Y
Revision	LEDs & Appendix B	Moved Distributor Lighting Measures from Retail/Residential TRM to Commercial, Industrial, Multifamily TRM	7/1/2018	Υ
Revision	Clothes Washer	Updated parameter values based on recent program data	7/1/2018	Υ

Change Type	TRM Section	Description	Effective Date	effRT update
Revision	HPWH	Updated measure costs based on most recent program data	7/1/2018	Y
Revision	Air Sealing and Insulation	Updated savings based on recent program parameters and adjusted base temperature to 60 degree F.	7/1/2018	Y
Revision	Duct Sealing, Duct Insulation	Updated savings to reflect cooling savings only for central cooling systems	7/1/2018	Υ
New	Window Inserts	Added new measure	7/1/2018	Υ
Correction	Smart Thermostat	Corrected heating savings value	7/1/2018	Υ
Revision	Appendix E	Fuel distributions updated based on program participation for boilers, furnace, pipe and duct insulation, air sealing, insulation, smart thermostats and water heaters. Fuel distribution updated based on Residential Baseline Study for lighting interactive effects	7/1/2018	Y
Other	On-Demand Natural Gas Water Heater	Updated Efficient definition to reflect program eligibility requirements	7/1/2018	N
Revision	LED	Updated cost and wattage for efficient bulbs based on program data	10/12/2018	Υ
Other	Low-Income Gas Heat	Expanded description to address heating/weatherization and retrofit/replace on burnout	10/1/2018	N
New	Hydronic Heating Smart Circulation Pump	New measure added to Home Energy Savings Program section.	10/1/2018	N
Revision	LED	Updated measure cost and efficient wattage based on program data. Savings and avoided O&M updated.	1/1/2019	Y
Revision	Low Income LED (all but AMP)	Applied updated fuel allocation	7/1/2018	Y
Revision	Low Income LED	Applied updated savings and fuel allocation	10/1/2018	Y
Revision	Heat Pump Water Heater	Updated measure cost based on program data	1/1/2019	Y
Correction	Low Flow Thermostatic Shower Valve	Updated effRT savings allocation for assumed ERHW proportion	7/1/2018	N
Revision	Appendix C: Carbon Dioxide Emission Factors	Updated Electricity emission factor to most recent ISO NE reported value.	1/1/2019	N
Revision	LED	Updated measure cost and FR based on program data. Baseline cost updated based on shelf survey. Avoided O&M updated to reflect new baseline cost.	4/1/2019	Y
PY2020 Upd	ates			
Other	All	Reorganized TRM by measure type rather than program	7/1/2019	N

Change Type	TRM Section	Description	Effective Date	effRT update
Revision	LEDs	Updated wattage and cost data with recent program data. Updated free ridership and baseline cost with CREED analysis. Updated equivalent measure life.	7/1/2019	Y
Revision	Air sealing, Insulation	Incorporated results from draft HESP Impact Evaluation – parameter assumptions, free ridership, and spillover	7/1/2019	Y
Revision	Boilers, furnaces	Incorporated results from draft HESP Impact Evaluation – realization rates, free ridership, and spillover. Updated baseline efficiency to industry standard.	7/1/2019	Y
Revision	Pellet/cord wood boiler, central geothermal	Incorporated results from draft HESP Impact Evaluation – program weighted free ridership, and spillover (non- evaluated measures)	7/1/2019	Y
Revision	Ductless heat pumps Ductless heat pumps Retrofit	Incorporated results from draft HESP Impact Evaluation – free ridership, spillover. Updated savings assumptions with new modeling and evaluated performance.	7/1/2019	Y
Revision	Wood and Pellet Stoves	Updated baseline efficiency assumption for 2020 NSPS compliant stoves	7/1/2019	Υ
Revision	Heat Pump Water Heater, Heat Pump Water Heater Direct Install	Incorporated results from draft HPWH Impact Evaluation – updated savings formula, application of an efficiency adjustment, ISR, FR. Updated incremental cost with recent program data.	7/1/2019	Y
Revision	Pellet/Cord Wood Boiler	Updated description and efficiency assumption with program data.	7/1/2019	Y
Revision	Window Inserts	Updated load shape factors based on new modeling.	7/1/2019	Y
Revision	Appendix F Baseline Bulb Replacement Schedule and Avoided O&M	Updated baseline bulb replacement schedule and discount rate.	7/1/2019	N
Revision	Low Flow Devices	Increased precision of kW value to avoid rounding errors in peak demand reduction.	7/1/2019	Y
Revision	Seal/Insulate Pipes/Ducts	Corrected fuel distribution for unknown fuel type	7/1/2019	Υ
Revision	Carbon Dioxide Emission Factors	Updated electricity factor with ISO NE all LMUs from 2017 emissions report	7/1/2019	N
Revision	Heat Pumps	New measure codes and new savings estimates for Tier 1 and Tier 2. Refinement of model input assumptions and resultant savings estimates. Refined energy period factors.	8/1/2019	Y

Change Type	TRM Section	Description	Effective Date	effRT update
Other	Low flow devices	Replaced Appliance Rebate with Retail Initiatives and added Low Income Initiatives to Programs	8/1/2019	N
Revision	Low flow devices and Direct Install LED	Updated In-Service Rate from HPWH Impact Evaluation	8/1/2019	Y
Revision	On Demand NG Water Heater	Updated EE assumptions to match updated program eligibility requirements	8/1/2019	Y
Correction	Basement Insulation	FR and SO updated with evaluation results	7/1/2019	N
Other	ECM Smart Pump	Distributor program added, commercial sector added, energy period factors added	7/1/2019	Y
Revision	HPWH	Revised input assumptions based on reviewed evaluation results Updated cost data with recent program data	11/1/2019	Y
Correction	Boilers and Furnaces	Corrected energy savings formula. Correct formula was used to calculate reported savings.	11/1/2019	N
Revision	Boilers and Furnaces	Measure codes updated to BOILM and FURNM to reflect their movement to midstream and addition of commercial use. FR and SO values reset to 25% and 0% due to their move to midstream. Added AHL formula for commercial savings calculation.	7/1/2019	Y
Revision	Tankless Water Heaters	Added TLWH measure code for distributor program. This measure is now also a commercial offering, and includes propane water heaters in addition to natural gas.	7/1/2019	Y
Revision	Tankless Water Heaters	Updated incremental measure cost with more recent data	7/1/2019	Υ
Other	Electronically Commutated Motor: Hydronic Heating Smart Circulation Pump	Added commercial savings. Residential and commercial measures are offered through the distributor program.	7/1/2019	Y
Correction	Window Inserts	Corrected the R-values.	7/1/2019	Υ
Revision	LEDs	Updated wattage and cost data with recent program data.	11/1/2019	Υ
Other	Emission Factors	Updated emission factors	11/1/2019	N
Revision	HPWH	Updated cost data with recent program data	1/1/2020	N
Revision	LED	Updated cost data with recent program data	1/1/2020	Υ

Change Type	TRM Section	Description	Effective Date	effRT update
Correction	CW	Corrected rounding error in reported kW reduction	7/1/2019	Y
Correction	Heat Pumps	Corrected winter peak demand reduction values for electric resistance back up heating system for HPSING <x>T<x> and HPMULT<x>T<x></x></x></x></x>	8/1/2019	N
Correction	Low Flow Devices	Corrected winter and summer peak demand reduction values for LFKA, LFBA, LFSH, TSV	7/1/2019	Y
Correction	Low Flow Devices	Corrected winter and summer peak demand reduction values for LILFKA, LILFBA, LILFSH	12/1/2019	Y
Other	TSTAT	Low Income measure added	2/1/2020	Υ
Revision	ECM Smart Pump	Cost data updated with shelf study results for ECMHW	4/1/2020	Υ
Other	Low Income NG Direct Install (DI) Insulation	Added LNBI measure code to LNAI removed inactive designator	7/1/2019	Y
Other	Low Income NG DI Air Sealing	Removed inactive designator	7/1/2019	Υ
Other	Throughout	Clarified that EFF values are percentages	N/A	N
Correction	Appendix B	Corrected ECM coincidence factors	7/1/2019	N
Correction	Heat Pumps	Corrected projected share of retrofit for tier 2 units Corrected Tier 2 efficient eligibility to 12.5 HSPF	8/1/2019	N
Correction	Wood & Pellet Stoves	Savings were incorrectly updated for NSPS 2020 compliance ahead of compliance date. Savings for 7/1/2019-3/31/2020 were 2.556 MMBtu/y.	7/1/2019	N
Revision	Wood & Pellet Stoves	Updated baseline efficiency to reflect NSPS 2020 compliant models.	4/1/2020	Υ
Revision	LED	Updated cost and wattage with recent program data	4/1/2020	Y
Revision	HPWH	Updated cost data with recent program data. Updated savings for blended baseline assumptions and FR rate from survey data.	7/1/2020	Y
Revision	LIHPWH	Added non-electric baseline savings	7/1/2020	Υ
Revision	LED	Updated cost and wattage with recent program data. Updated FR rate with CREED 2019 results. Updated measure life to account for market transformation.	7/1/2020	Y
Revision	Low Flow Devices	Added new measure codes for LI showerhead to distinguish handheld from wall mount. Added program negotiated prices for LI.	7/1/2020	Y

Change Type	TRM Section	Description	Effective Date	effRT update
Other	Heat Pumps	Added cooling assumptions for retrofit scenarios. Corrected Low Income measure cost to "actual" (documentation only correction).	7/1/2020	N
Revision	Tankless Water Heater	Defined deemed hot water use for commercial applications. Replaced thermal efficiency and standby loss algorithm for commercial applications with equivalent energy factor.	7/1/2020	Y
Revision	Window Inserts	Added air infiltration reduction	7/1/2020	Υ
Other	Pellet/Cord Wood Boiler	Added Commercial to Sector	7/1/2020	Υ
Revision	LED	Updated cost and wattage with recent program data.	11/1/2020	Υ
Revision	HPWH	Updated cost data with recent program data.	11/1/2020	Υ
Revision	LED	Updated cost and wattage with recent program data.	3/1/2020	Υ
Revision	HPWH	Updated cost data with recent program data.	3/1/2021	Υ
Correction	LIHPWH	Added missing electric impact for non- electric baseline	7/1/2021	N
Revision	Carbon Dioxide Emission Factors	Updated electricity factor with ISO NE all LMUs from 2019 emissions report		N
Revision	HPWH	Updated cost data based on distributor pricing due to rapid price increase	7/1/2021	Y
Revision	RAP	Updated efficiency assumptions	7/1/2021	Υ
Revision	Table 11	Matched insulation fuel distribution to Air Sealing and Window Inserts	7/1/2021	Υ
Revision	LED	Updated cost and wattage with recent program data. Updated interactive effects, CF and EPF from evaluation results.  Updated incremental cost, and free ridership from CREED data.	7/1/2021	Y
Revision	HPSING1T1, HPSING2T1, HPSING1T2, HPSING2T2, HPMULT1T1, HPMULT2T1	Updated savings from revised modeling with better matched baseline HP capacity and corrected peak demand coincidence.  Added to footnote that weighted average of Retrofit and Lost Opportunity is used for Tier 2 units.	7/1/2021	Y
Addition	Transportation: BEV and PHEV	New transportation section and corresponding additions to Appendix B	Retroactive 7/1/2020	Υ
Revision	Insulation	Replaced deemed per zone savings with site specific calculated savings.		
Revision	LED	Updated cost and wattage with recent program data.	3/10/2022	Y
Revision	HPWH	Updated cost data based on recent program data	3/10/2022	Y

Change Type	TRM Section	Description	Effective Date	effRT update
Revision	BEV, PHEV	Modified peak demand impacts and energy period factors based on refined metering analysis	Retroactive to 7/1/2021	Υ
Revision	LWI	Updated cost with recent program data	3/10/2022	Υ
Revision HPSING1T1, HPSING2T1, HPSING1T2, HPSING2T2, HPMULT1T1, HPMULT2T1, HPMULT1T2, HPMULT2T2		Updated retrofit HP measure cost. Added HPMULT1T2, HPMULT2T2 measure codes	Retroactive to 3/1/2022	Y
Correction	Specialty LED Bulb	Corrected summer and winter coincidence factors to reflect evaluation findings. effRT implementation was correct.	Retroactive to 7/1/2021 and 3/10/2022	N
Correction	Appendix B	Updated energy period factors to reflect updated HP savings modeling from 7/1/2021 TRM update. EPF were implemented correctly in effRT at the time of the update.	Retroactive to 7/1/2021	N
Revision	Appendix B	Updated energy period factors for air sealing and insulation to reflect electric portion of fuel blend (HESP) and proper cooling only factors (AHI).	5/1/2022	Y
Correction	LEDs	Corrected ISR to properly reflect evaluation findings.	Retroactive to 7/1/2021	Υ
Revision	BEV, PHEV	Added avoided O&M costs	Retroactive to 7/1/2021	N
Revision	LED	Updated cost and wattage with recent program data. Updated baseline cost, avoided O&M, and free ridership from CREED data.	7/1/2022	Y
Revision	HPWH	Updated cost with recent program data	7/1/2022	Υ
Revision	PHEV	Updated MPG for PHEV.	7/1/2022	Υ
Revision	МНВВ	Added underbelly zone to suite of insulation measures, removed inactive mobile home underbelly (Component of LUB) measure. Added fuel distribution for "unknown" fuel specific to mobile homes.	7/1/2022	Y
Revision	НР	Updated assumed retrofit portion for tier 2 heat pumps based on recent program activity. Added new measure codes for multizone tier 2 measures.	7/1/2022	Y
Revision	Emission Factors	Updated emission factors with most recent EIA and ISO NE reported values	7/1/2022	N
Correction	LCHA, LCHL, LCHD	Corrected non-electric deemed savings. effRT implementation was correct	7/1/2020	N
Revision	HPWH	Updated cost with recent program data	10/1/2022	Υ

Change Type	TRM Section	Description	Effective Date	effRT update
Revision	LED	Updated cost and wattage with recent program data.	10/1/2022	Υ
Correction	Insulation	Added CFM50 to CFH natural conversion. effRT formulas correct	9/3/2021	N
Correction	Table: Insulation Zone Parameters	Updated CFM row to be CFM50 values not CFM natural	9/3/2021	N
Revision	HPWH	Updated cost with recent program data	1/1/2023	Υ
Revision	Electric Vehicles	Updated incremental cost with recent program data	1/1/2023	Υ
Other	Lighting	Retail LEDs marked inactive (LILEDs remain active)	1/1/2023	Y
Revision	HPWH <x></x>	Updated cost with recent program data	7/1/2023	Υ
Revision	LIHPWH; HPHW <x></x>		7/1/2023	Υ
Revision	BOILM	Updated baseline and efficient equipment efficiency, and incremental cost based on distributor interview.  Marked measure inactive.	7/1/2023	Υ <sup>5</sup>
Revision	TLWH	Updated baseline and efficient equipment efficiency, and incremental cost based on distributor interview.  Marked measure inactive.	7/1/2023	Υ <sup>6</sup>
Revision	B <x>, LB<x>, MB<x>, IR, LIR, MIR</x></x></x>	Air sealing bonus removed from insulation measures. Air sealing measure modified to be calculated savings using pre/post CFM50 measurement to capture all air sealing savings in the IR, LIR and MIR measures. AA, LAA measures removed.	7/1/2023	Y
Revision	RAP	Updated measure cost based on shelf study and marked measure inactive.	7/1/2023	Y <sup>7</sup>
Revision	АРВ	Updated baseline fuel efficiency and incremental cost based on recent program data	10/1/2023	Y
Revision	GHP	Updated incremental cost based on recent program data	10/1/2023	Υ
New	<li ai="" mi="">WHHPR</li>	Added Whole Home Heat Pump measure	9/18/2023	Υ
Revision	GHP	Updated efficient measure to reflect water-to-air closed loop system (most common installation type) Updated baseline EER to match ASHRAE 2009 for single package system.	1/1/2024	Y

Implementation of change in effRT will be delayed allowing for processing of carryover claims from previous year.
 Implementation of change in effRT will be delayed allowing for processing of carryover claims from previous year.
 Implementation of change in effRT will be delayed allowing for processing of carryover claims from previous year.

Davisian	TRM Section Description		Effective Date	effRT update
Revision	<li ai="" mi="">WHHPR</li>	Distinguished freerider rates for all income, moderate, and low income. Update energy impacts based on DHP model scaled to whole home. Added separate entry in Appendix B for coincidence and energy period factors.	9/18/2023	Υ
Correction	АРВ	Corrected deemed oil savings consistent with assumed parameters. Corrected baseline description consistent with deemed savings. effRT implementation correct. Corrected NC/ROB factor in measure cost calculation. Measure cost correct	10/1/2023	N
Revision	HPWH <x></x>	Updated measure cost based on recent program data	4/1/2024	Υ
Correction	<x>IR, <x>BA, <x>BB, <x>BW, <x>BU</x></x></x></x></x>	Added efficiency assumptions for electric resistance and electric heat pump heating systems	12/14/2023	Υ8
Revision	Appendix C: Carbon Dioxide Emission Factors		7/1/2023	N
Revision	GHP	Updated measure cost to remove baseline cost reduction to better reflect current industry practice.	4/1/2024	Y
Other	HPWH <x></x>	Added HPWHB measure code for bulk distributor HPWH rebates	1/1/2024	Υ
Revision	<x>BEV, <x>PHEV</x></x>	Updated kW impacts and Energy Period Factors based on Dunsky Load Impacts report, 2024	7/1/2024	Υ
New	BEVMCP, PHEVMCP	Added Electric Vehicle Managed Charging measure	Retroactive to 7/1/2023	Υ
New	DR1	Added Curtailment measure	Retroactive to 7/1/2022	Υ
New	Appendix G	Added Appendix for Baselining Calculation Methodology for Demand Response Measures	Retroactive to 7/1/2022	Υ
Revision	HPWH <x></x>	Updated measure cost based on recent program data	7/1/2024	Υ
Revision	<x>WHHPR</x>	FR and SO and Model inputs updated to reflect the findings of the Ridgeline Energy Analytics, Residential Heat Pump Impact Evaluation, 2024		Y
Revision  Correction	LCH <x></x>	FR, deemed savings and energy period factors updated to reflect the findings of the Ridgeline Energy Analytics, Residential Heat Pump Impact Evaluation, 2024 Corrected gasoline savings calculation	7/1/2024 7/1/2023	Y

<sup>8</sup> Electric resistance efficiency has always been correct in effRT. Heat pump efficiency added 12/14/2023 with the additional selection of heat pump for primary heating system. Heat pump efficiency value corrected retroactively to 12/14/2023.

Change Type	TRM Section	Description	Effective Date	effRT update
New	MHWHHP	New measure for manufactured (mobile) home whole home heat pump	7/1/2022	Υ <sup>9</sup>
Revision	HPWH <x></x>	Updated measure cost based on recent program data	1/1/2025	Υ
Revision	HPWH <x></x>	Updated measure cost based on recent program data. Updated COP to UEF based on recent program data.	4/1/2025	Y
Revision	ECMHW	Incorporated evaluation impact findings. Note that NTG results were not available at the time of this update and will be incorporated into the 2026 TRM.	4/1/2025	Y
New	SBAT <x></x>	Added Small Battery Management measure.	Retroactive to 7/1/2024	Υ
New	OPC <x></x>	Added Off-Peak Charger measure.	4/1/2025	Υ
Revision	Appendix C: Carbon Dioxide Emission Factors	Updated with more recent EPA and ISO NE data	4/1/2025	N
Other	Lighting	Removed lighting section – no active measures	7/1/2025	N
Revision	HPWH <x></x>	Updated measure cost based on recent program data. Updated UEF based on recent program data.	7/1/2025	Y

Correction: indicates a correction to an existing error in the previous TRM.

New: indicates a measure that was not included in the previous TRM

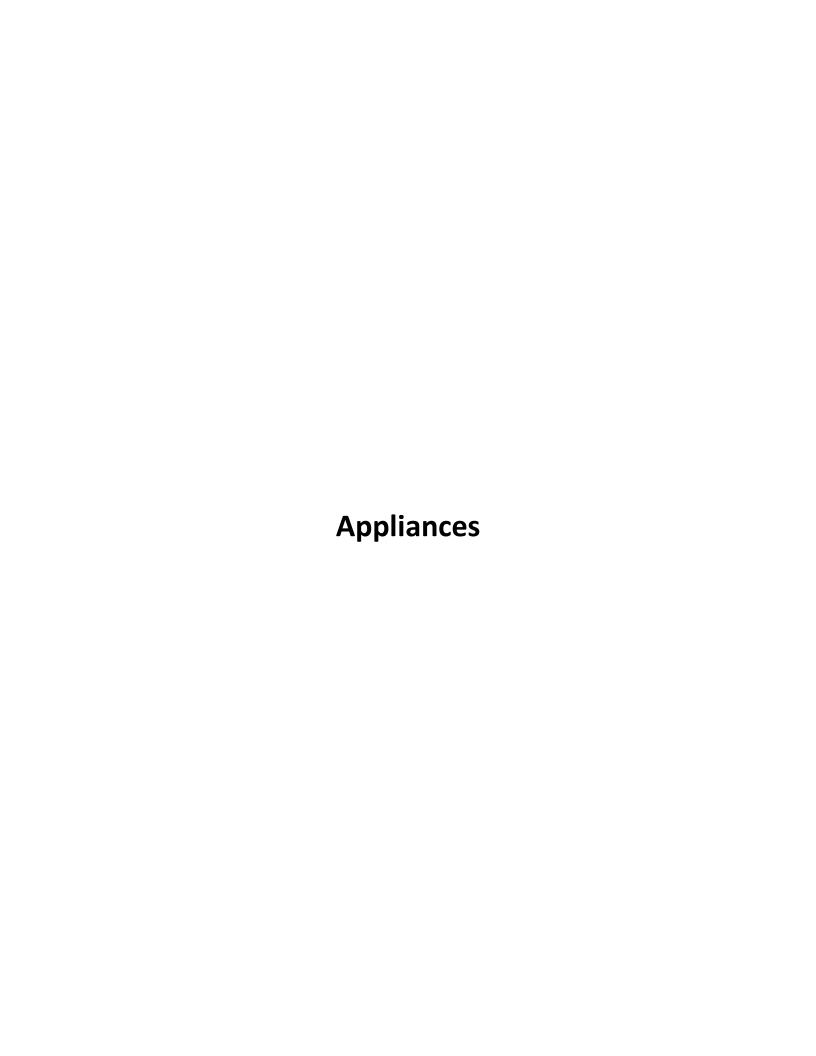

Revision: indicates a revision to the savings or costs of an existing measure

Removal: indicates a removal of measure that is discontinued

Other: indicates a change to an existing measure or existing text and that does not affect savings or cost calculation

Note: The Change Log provides a running history of changes in chronological order. More recent changes take precedence over previous changes. Previous change log entries are not updated so as to provide historic reference to past changes.

<sup>&</sup>lt;sup>9</sup> Impacts were implemented in effRT October 21, 2022.

Refrigerator (Inactive)	(RF)							itor (mactive) (Kr)
Last Revised Date	7/1/2015							
MEASURE OVERVIEW	, ,							
Description	ENERGY STA efficiency re The ENERG percent mo	ENERGY STAR® Refrigerator. This measure involves the purchase and installation of a new ENERGY STAR®-certified refrigerator in place of a new code-compliant or standard efficiency refrigerator.  The ENERGY STAR® key efficiency criteria requires that full-size refrigerators be at least 20 percent more energy efficient than the minimum federal standard. A list of certified ENERGY STAR® refrigerators is available at:

<sup>11</sup> NMR Group, Inc., Efficiency Maine Appliance Rebate Program Evaluation Overall Report – FINAL, July 18, 2014, p. 30.

<sup>12</sup> Memo provided to supplement NMR Group, Inc., Efficiency Maine Appliance Rebate Program Evaluation Overall Report – FINAL, July 18, 2014.

<sup>&</sup>lt;sup>13</sup> Federal Standard, Code of Federal Regulations, Title 10, Part 430, Subpart C.

<sup>&</sup>lt;sup>14</sup> Table 15.

<sup>&</sup>lt;sup>15</sup> Ibid., p. 28. The in-situ adjustment (ISA) factor is a correction factor applied to a refrigerator's rated kWh consumption to reflect real world conditions, such as door openings, food in the refrigerators, internal temperature settings, and ambient conditions. The ISA factor for refrigerators was derived by comparing the *actual* (metered) kWh consumption with the *rated* kWh consumption; the ratio of each refrigerator's actual metered kWh consumption to its rated kWh consumption was calculated and averaged to calculate the ISA factor.

<sup>&</sup>lt;sup>16</sup> ENERGY STAR Appliance Calculator.

<sup>&</sup>lt;sup>17</sup> NMR Group, Inc., Efficiency Maine Appliance Rebate Program Evaluation Overall Report – FINAL, July 18, 2014, Table 2-41.

<sup>&</sup>lt;sup>18</sup> Realization rates are 100 percent since savings estimates are based on evaluation results.

 $<sup>^{\</sup>rm 19}$  Peak coincidence factors for this measure are embedded in the evaluated peak demand impacts.

	IMEFEE	= Rated Integrated Modified Energy Factor for ENERGY STAR® model (ft³/kWh/cycle)
	Loads	= Washer loads per year (cycles/yr)
	%Е <sub>масніпе_в</sub>	= Percentage of baseline clothes washer system energy used for washer machine
	%E <sub>MACHINE_EE</sub>	= Percentage of ENERGY STAR® clothes washer system energy used for washer machine
	%Е <sub>DНW_В</sub>	= Percentage of baseline clothes washer system energy used for water heating
	%E <sub>DHW_EE</sub>	= Percentage of ENERGY STAR® clothes washer system energy used for water heating
	%E <sub>DRYER_B</sub>	= Percentage of baseline clothes washer system energy used for the clothes dryer
	%E <sub>DRYER_EE</sub>	= Percentage of ENERGY STAR® clothes washer system energy used for the clothes dryer
	%Dried	= Percentage of washed loads that are dried in dryer (%)
	CAPEE	= Rated capacity of the installed clothes washer (ft <sup>3</sup> )
	%DHW <sub>GAS</sub>	= Percentage of homes with natural gas water heating (%)
	%DHW <sub>OIL</sub>	= Percentage of homes with oil water heating (%)
	%DHW <sub>PROP</sub>	= Percentage of homes with propane or LNG water heating (%)
	%Dryer <sub>GAS</sub>	= Percentage of homes with gas clothes dryers (%)
	%Dryer <sub>PROP</sub>	= Percentage of homes with propane or LNG clothes dryers (%)
	Eff <sub>GAS</sub>	= Efficiency of existing gas-fired water heaters (%)
	Eff <sub>OIL</sub>	= Efficiency of existing oil-fired water heaters (%)
	Eff <sub>PROP</sub>	= Efficiency of existing propane-fired water heaters (%)
	IWF <sub>BASE</sub>	= Rated integrated water factor for the baseline clothes washer
		(gallons/cycle/ft³)
	IWFEE	= Rated integrated water factor for the ENERGY STAR® clothes washer
		(gallons/cycle/ft³)
	0.003412	= Conversion factor: 0.003412 MMBtu per kWh
EFFICIENCY ASSUMPTIONS		
Baseline Efficiency		es washer. The current federal standard requires a minimum IMEF of 1.29
		for top loading machines and IMEF of 1.84 and IWF of 4.7 for front loading
		se standards are valid for clothes washers manufactured on or after March
Eff: -1 - 1 A A	7, 2015.	0
Efficient Measure	ENEKGY STAR®	-certified clothes washer.

	Low-flow Kitchen Aerator (LFKA, LILFKA)
Low-flow Kitchen Aera	tor (LFKA, LILFKA, Component of LUB)
Last Revised Date	4/1/2020 (retroactive to 11/1/2019 for Low Income, 7/1/2019 for Retail)
MEASURE OVERVIEW	
Description	This measure involves the replacement of existing kitchen aerators with low-flow aerators.
Primary Energy Impact	Electric (additional impacts include: water)
Sector	Residential
Program(s)	Retail Initiatives, Low Income Initiatives
End-Use	Domestic Hot Water
Decision Type	Retrofit
	SAVINGS (UNIT SAVINGS)
Demand Savings <sup>83</sup>	HPWH: $\Delta kW_{WP} = 0.012$ $\Delta kW_{SP} = 0.010$
	ERWH: $\Delta kW_{WP} = 0.043$ $\Delta kW_{SP} = 0.034$
Annual Energy	HPWH: ΔkWh/y = 79 ERWH: ΔkWh/y = 283
Savings <sup>84</sup>	Natural Gas or Propane Fired Water Heater: ΔMMBtu/y = 1.40
	Oil or Kerosene Fired Water Heater: ΔMMBtu/y = 1.61
Annual Water Savings	ΔGallons/yr = 2,696
	ALGORITHMS (UNIT SAVINGS)
Demand Savings	$\Delta kW_{SP} = \Delta kWh/y \times F_{ED,SP}$
	$\Delta kW_{WP} = \Delta kWh/y \times F_{ED,WP}$
Annual Energy Savings	$\Delta kWh/y = N_{ppl} \times t \times 365 \times (GPM_{BASE} - GPM_{EE}) / N_{fixtures} \times \rho_{H20} \times Cp_{H20} / 3,412 \times (T_{pou} - T_{in}) /$
	RE <sub>WH</sub>
	$\Delta MMBtu/y = N_{ppl} \times t \times 365 \times (GPM_{BASE} - GPM_{EE}) / N_{fixtures} \times \rho_{H20} \times Cp_{H20} / 1,000,000 \times (T_{pou} - T_{pou} - T_{pou}$
	T <sub>in</sub> ) / RE <sub>WH</sub>
Annual Water Savings	$\Delta$ Gallons/y = N <sub>ppl</sub> × t × 365 × (GPM <sub>BASE</sub> – GPM <sub>EE</sub> ) / N <sub>fixtures</sub>
Definitions	Unit = 1 kitchen aerator
	F <sub>ED,WP</sub> = Energy to Winter Peak Demand ratio (kW/kWh)
	F <sub>ED,SP</sub> = Energy to Summer Peak Demand ratio (kW/kWh)
	N <sub>ppl</sub> = Number of people per home (person/home)
	t = Total time all kitchen aerators are used per day per person (min/day/person)
	GPM <sub>BASE</sub> = Baseline flowrate of kitchen aerator (gallon/min)
	GPM <sub>EE</sub> = Measure flowrate of kitchen aerator (gallon/min)
	N <sub>fixtures</sub> = Number of kitchen sinks (sinks/home)
	T <sub>pou</sub> = Temperature at point of use (°F)
	T <sub>in</sub> = Temperature of water mains (°F)
	RE <sub>WH</sub> = Recovery efficiency of water heater
	$\rho_{H20}$ = Density of water (8.33 lbs per gallons)
	Cp <sub>H20</sub> = Specific heat of water: 1 Btu/lb/°F
	3,412 = Conversion: 3,412 Btu per kWh
	1,000,000 = Conversion: 1,000,000 Btu per MMBtu
	= Conversion: 365 days per year
EFFICIENCY ASSUMPTION	
Baseline Efficiency	Federal standards set a maximum 2.2 GPM for faucet aerators manufactured after January 1, 1994.85
Efficient Measure	High-efficiency Kitchen Faucet Aerator (1.5 GPM)

<sup>&</sup>lt;sup>83</sup> For consumer products where water heater type is unknown, in effRT, savings listed in TRM are multiplied by the distribution of water heater fuel types found in the NMR, 2015 Maine Residential Baseline Study. The factors are 25% for ERWH, and 5% for HPWH.

<sup>&</sup>lt;sup>84</sup> For consumer products where water heater type is unknown, in effRT, savings listed in TRM are multiplied by the distribution of water heater fuel types found in the NMR, 2015 Maine Residential Baseline Study. The factors are 25% for ERWH, 5% for HPWH, 5% for Natural Gas, 5% for Propane, 60% for Oil.

<sup>&</sup>lt;sup>85</sup> Federal Standard, Code of Federal Regulations, Title 10, Part 430, Subpart C.

<sup>&</sup>lt;sup>241</sup> Engineering assumption, conservative compared to Illinois 2012 TRM which claims 15°F setback.

<sup>&</sup>lt;sup>242</sup> The risk of bacteria growing in the stored hot water increases when the set-point temperature is reduced below 120°F: http://www.ncbi.nlm.nih.gov/pmc/articles/PMC2094925/#B5

<sup>&</sup>lt;sup>243</sup> Savings are captured by calculating energy savings from reducing the temperature of the water consumed by the following end uses: leaks, clothes washers and the use categorized by "other." No savings are claimed from hot water end uses such as showering or faucet use because it is assumed that the user will continue to operate the end use at the same temperature as prior to implementing this measure. By operating at the same temperature, the user uses water with the same amount of energy as before (thereby not reducing energy use directly). Daily water usages are based on EPA's WaterSense guide: <a href="http://www.epa.gov/WaterSense/docs/home\_suppstat508.pdf">http://www.epa.gov/WaterSense/docs/home\_suppstat508.pdf</a>. Savings include reduced standby losses.

<sup>&</sup>lt;sup>290</sup> For multizone systems the savings are equal to the sum of "1st Unit" plus only one "Additional Unit" except in the special case where the 1st unit is a single zone unit and the second unit is a multizone unit. In this special case, the single zone unit is assigned the "1st Unit" savings and the multizone unit is assigned savings for one "Additional Unit."

<sup>&</sup>lt;sup>291</sup> For multizone systems the savings are equal to the sum of "1st Unit" plus only one "Additional Unit" except in the special case where the 1st unit is a single zone unit and the second unit is a multizone unit. In this special case, the single zone unit is assigned the "1st Unit" savings and the multizone unit is assigned savings for one "Additional Unit."

<sup>&</sup>lt;sup>292</sup> Enhanced incentives starting in FY2020 will drive some level of retrofit within the market-based program. Savings for Tier 2 units are assigned a blend of lost opportunity and retrofit in effRT. The ratio of the blend is set at 77% retrofit for the 1<sup>st</sup> tier 2 unit and 0% retrofit for the 2<sup>nd</sup> tier 2 unit based on FY22 program activity.

	mp Residential Lost Opportunity (CH, HPSING1T1, HPSING2T1, HPSING1T2,
	(2, HPMULT2T1, HPMULT1T1, HPMULT1T2, HPMULT2T2)  VINGS ALGORITHMS (UNIT SAVINGS)
Demand Savings	Modeled <sup>293</sup>
Annual Energy	Modeled <sup>294</sup>
Savings	Heating and cooling savings are modeled using TMY3 data for Portland, Bangor and Caribou. Results are weighted based on population (71.2% Portland, 23.4% Bangor, 5.4% Caribou). <sup>295</sup>
	<ul> <li>Savings were calculated based on a model employing the following key assumptions:         <ul> <li>Heating and cooling are temperature and season dependent. A behavior model is applied to the TMY3 data to avoid out of season heating and cooling.<sup>296</sup></li> <li>Heating is called for when outside air temperature is less than or equal to 60°F (heating balance point).<sup>297</sup> Cooling is called for when outside temperature is more than 70F (cooling balance point).</li> </ul> </li> </ul> <li>Outdoor Heating design temperatures are -2F for Bangor, -10 for Caribou and 2 for</li>
	Portland. Outdoor Cooling design temperatures are 86F for Bangor, 81F for Caribou and 83F for Portland. 298  • EE Heat pump capacity by temperature is weighted average based on program
	saturation and rated performance. Baseline heat pump capacity by temperature is weighted average of corresponding standard efficiency.
	<ul> <li>Design load is proportional to the design capacity of the heat pump as defined by the sizing factor.</li> </ul>
	<ul> <li>Heating and cooling loads are linearly dependent on temperature between the balance point and design temperature.</li> </ul>
	<ul> <li>Tier 1 EE Heat pump coefficient of performance by temperature is based on in-situ evaluated performance and varies linearly with temperature.<sup>299</sup></li> </ul>
	<ul> <li>Tier 2 EE heat pump COP is based on weighted average of rated performance of qualifying units adjusted by the same factor found between rated performance and evaluated performance.</li> </ul>
	<ul> <li>Baseline heat pump COP is based on weighted average of rated performance adjusted by the same factor found between rated performance and evaluated performance for EE Heat Pump.</li> </ul>
	<ul> <li>There is an interaction between the heat pump and the central system based on occupant behavior, building characteristics and capacity differences. This interaction is modeled through a load factor and a capacity ratio. When the existing heating system is electric resistance baseboard, heat is only called for when the heat pump capacity falls below the heat loss (i.e. perfect gap filling).</li> </ul>

- Energy savings are measured against the baseline heat pump up to its capacity. Above the baseline heat pump's capacity, energy savings are measured against the central heating system.
- EE heat pump is used in the same manner as the baseline heat pump would have been for both heating and cooling.

<sup>&</sup>lt;sup>293</sup> DHP\_Model developed by Efficiency Maine Trust and Bruce Harley Energy Consulting.

Ductless Heat P	ump	100%313	100%314	100%314	100%315				42% <sup>3</sup>	16	11% <sup>317</sup>	

<sup>&</sup>lt;sup>300</sup> A sizing factor of 1 indicates that the heat pump capacity at the design temperature is perfectly matched to the heat loss of the area it serves, alternately, the area served by the heat pump is matched to the heat pump's capacity at the design temperature.

<sup>&</sup>lt;sup>301</sup> A load factor of 3.5 indicates that heat is called for from the central system when the temperature specific heat pump capacity falls below 3.5 times the heat loss of the area being served. The value is based on empirical data.

<sup>302</sup> NMR, 2015 Maine Residential Baseline Study

<sup>303</sup> Capacity of central heating system is set at 1.5 times the design load of the area served by the heat pump for non-electric resistance heating systems.

<sup>304</sup> GDS Associates, Inc., Measure Life Report – Residential and Commercial/Industrial Lighting and HVAC Measures, June 2007; Table 1.

<sup>&</sup>lt;sup>305</sup> The incremental cost is the difference in cost between a typical high-efficiency unit (\$1,645 based on Fujitsu model 12RLS2, ecomfort.com) and a typical baseline unit (\$963 based on LG model LS093HE, ecomfort.com). Enhanced incentives starting in FY2020 will drive some level of retrofit within the market-based program. Measure costs for Tier 2 units are assigned a blend of lost opportunity and retrofit in effRT. The ratio of the blend is set at 100% retrofit for HPSING1T2 and 36% retrofit for HPSING2T2 based on FY2021 program activity and assumed volume growth without the enhanced incentives.

<sup>&</sup>lt;sup>306</sup> A sizing factor of 1.8 indicates that the heat pump is oversized for the area it serves. Represents a 2<sup>nd</sup> heat pump being located in a less than ideal location.

<sup>&</sup>lt;sup>307</sup> A load factor of 3.6 indicates that heat is called for from the central system more often. Represents a 2<sup>nd</sup> heat pump that is only heating a small portion of a central heating system zone.

<sup>&</sup>lt;sup>308</sup> A sizing factor of 1 indicates that the heat pump capacity at the design temperature is perfectly matched to the heat loss of the area it serves, alternately, the area served by the heat pump is matched to the heat pump's capacity at the design temperature.

<sup>&</sup>lt;sup>309</sup> A load factor of 2.8 indicates that heat is called for from the central system when the temperature specific heat pump capacity falls below 2.8 times the heat loss of the area being served. The value is based on empirical data.

<sup>310</sup> Capacity of central heating system is set at 1.5 times the design load of the area served by the heat pump for non-electric resistance heating systems.

<sup>&</sup>lt;sup>311</sup> A sizing factor of 1.8 indicates that the heat pump is oversized for the area it serves. Represents a 2<sup>nd</sup> heat pump being located in a less than ideal location.

<sup>&</sup>lt;sup>312</sup> A load factor of 3.6 indicates that heat is called for from the central system more often. Represents a 2<sup>nd</sup> heat pump that is only heating a small portion of a central heating system zone.

<sup>313</sup> EMT assumes that all purchased units are installed (i.e. ISR = 100%). This is consistent with the MA 2013-2015 TRM.

<sup>314</sup> Modeled results informed by evaluation findings.

 $<sup>^{\</sup>mbox{\scriptsize 315}}$  The on-peak summer and winter kW savings are calculated directly from the modeling.

Manufactured Home \	Whole Home Heat Pump (MHWHHP)
Last Revised Date	10/1/2024 (retroactive to 10/21/2022)
MEASURE OVERVIEW	
Description	This measure involves the retrofit of high-efficiency heat pumps that replace existing
	heating systems in manufactured homes (mobile homes).
Energy Impacts	Kerosene, Propane, Electricity
Sectors	Residential
Program(s)	Low & Moderate Income Program
End-Use	8
Decision Type	Retrofit
DEEMED GROSS ENERGY	Y SAVINGS (UNIT SAVINGS)
Demand savings	See Table 4
Annual energy savings	C ALCODITURAS (UNUT CAMBIOS)
	S ALGORITHMS (UNIT SAVINGS)
Demand Savings	Modeled <sup>363</sup>
Annual Energy Savings	Modeled <sup>364</sup>
	Heating and cooling savings are modeled using TMY3 data for Portland, Bangor and Caribou. Weighted average results are based on population (71.2% Portland, 23.4%
	Bangor, 5.4% Caribou). 365
	bungor, 3.4% caribody.
	Savings were calculated based on a model employing the following key assumptions:
	Heating and cooling are temperature and season dependent. A behavior model is
	applied to the TMY3 data to avoid out of season heating and cooling. 366
	<ul> <li>Heating is called for when outside air temperature is less than or equal to 60°F</li> </ul>
	(heating balance point). 367 Cooling is called for when outside temperature is more
	than 70F (cooling balance point).
	<ul> <li>Outdoor Heating design temperatures are -2F for Bangor, -10 for Caribou and 2</li> </ul>
	for Portland. Outdoor Cooling design temperatures are 86F for Bangor, 81F for Caribou and 83F for Portland. 368
	<ul> <li>Heat pump capacity and coefficient of performance versus temperature is based on manufacturer reported values for indoor temperature of 70 degrees.</li> </ul>
	<ul> <li>Design load is proportional to the design capacity of the heat pump as defined by the sizing factor.</li> </ul>
	Heating and cooling loads are linearly dependent on temperature between the
	<ul> <li>balance point and design temperature.</li> <li>There is an interaction between the heat pump and the backup electric resistance</li> </ul>
	<ul> <li>There is an interaction between the heat pump and the backup electric resistance heat (if present) based on occupant behavior, building characteristics and capacity</li> </ul>
	differences. This interaction is modeled through a load factor and a capacity ratio.
	<ul> <li>Each btu provided by the heat pump offsets a btu produced by the backup system.</li> </ul>
	40% of homes have installed cooling equivalent to the cooling provided by the
	heat pump. 21% of homes do not have installed any cooling. The balance of the
	homes has partial cooling.
Definitions	Unit = one home with a ducted heat pump installed
	SF = sizing factor - ratio of the heat pump capacity at design temperature to
	heat loss at design temperature
	· · · · · · · · · · · · · · · · · · ·

	Pellet/Cord Wood Boiler (APB)					
Pellet/Cord Wood Be	oiler (APB)					
Last Revised Date	4/1/2024 (retroactive to 10/1/2023)					
MEASURE OVERVIEW						
Description	This measure involves purchase and installation of a pellet or cord wood boiler as a whole-					
	home heating system rather than a new fossil-fuel boiler.					
Energy Impacts	Wood, Oil					
Sector	Residential, Commercial					
Program(s)	Home Energy Savings Program					
End-Use	Heating					
Decision Type	New Construction, Replace on Burnout, Retrofit					
DEEMED GROSS ENERG	GY SAVINGS (UNIT SAVINGS)					
Demand savings	$\Delta kW_{SP} = NA$					
	$\Delta kW_{WP} = NA$					
Annual energy	$\Delta$ MMBtu <sub>WOOD</sub> =-79.302					
savings	$\Delta$ MMBtu <sub>NG</sub> = 2.187					
	$\Delta$ MMBtu <sub>PROPANE</sub> = 4.374					
	$\Delta$ MMBtu <sub>OIL</sub> = 68.119					
	$\Delta$ kWh = 200					
GROSS ENERGY SAVIN	GS ALGORITHMS (UNIT SAVINGS)					
Demand savings	$\Delta kW = NA$					
Annual Energy	$\Delta$ MMBtu <sub>BASEFUEL</sub> /yr = MMBtu <sub>HEAT</sub> x ( 1 / EFF <sub>BASENEW</sub> x (1 - %Ret) + 1 / EFF <sub>BASEEX</sub> x (%Ret)) x					
savings	%FUEL <sub>BASE</sub>					
	$\Delta$ kWh <sub>BASEFUEL</sub> /yr = MMBtu <sub>HEAT</sub> x ( 1 / EFF <sub>BASENEW</sub> x (1 - %Ret) + 1 / EFF <sub>BASEEX</sub> x (%Ret)) x					
	%FUEL <sub>BASE</sub> /0.003412					
	$\Delta$ MMBtu <sub>NEWFUEL</sub> /yr = - ( MMBtu <sub>HEAT</sub> x 1 / EFF <sub>PB</sub> ) x %FUEL <sub>EE</sub>					
Definitions	Unit = New pellet boiler					
	AHL = Average annual heating load for Maine home (MMBtu)					
	EF <sub>BASENEW</sub> = Average baseline heating system efficiency (%) for new systems					
	EF <sub>BASEEX</sub> = Average baseline heating system efficiency (%) for existing systems					
	%Ret = Precent of projects that are retrofit. Remaining is combination of new					
	construction and replace on burnout					
	EF <sub>PB</sub> = Average pellet boiler heating system efficiency (%)					
	%FUEL <sub>BASE</sub> = Distribution of fuel types for baseline boilers					
	%FUEL <sub>EE</sub> = Distribution of fuel types for efficient boilers					
	0.003412 = kWh to MMBtu conversion					
EFFICIENCY ASSUMPTI						
Baseline Efficiency	The baseline case is a blend of new wood stoves and new standard efficiency fossil fuel boilers					
E.C	and retrofit of wood stoves and fossil fuel boilers.					
Efficient Measure	The high-efficiency case assumes the home replaces its heating system with a new pellet boiler					
	that meets the minimum efficiency requirements for program rebate.

	Central Air-source Heat Pump (ducted) (DHA) (Inactive)
Central Air-source H	leat Pump (ducted) (DHA) (Inactive)
Last Revised Date	4/1/2018
MEASURE OVERVIEW	
Description	This measure involves the purchase and installation of new high-efficiency air-source heat
	pump for central heating and cooling rather than a new standard-efficiency air-source heat
	pump. Energy savings are achieved by the improved efficiency of the installed equipment
	compared to federal standards.
Energy Impacts	Electric
Sector	Residential
Program(s)	Home Energy Savings Program
End-Use	Heating, Cooling
Decision Type	New Construction, Replacement
DEEMED GROSS ENER	GY SAVINGS (UNIT SAVINGS)
Demand savings	$\Delta$ kW <sub>SP</sub> = 0.013
	$\Delta$ kW <sub>WP</sub> = 0.395
Annual energy	$\Delta$ kWh/yr = 2,062
savings	
GROSS ENERGY SAVIN	IGS ALGORITHMS (UNIT SAVINGS)
Demand savings	$\Delta kW_{SP} = CAP_C \times (1 / EER_{BASE} - 1 / EER_{EE}) \times CF_{SP}$
	$\Delta kW_{WP} = CAP_H \times (1 / HSPF_{BASE} - 1 / HSPF_{EE}) \times CF_{WP}$
Annual Energy	$\Delta kWh = \Delta kWh_{COOL} + \Delta kWh_{HEAT}$
savings	$\Delta$ kWh <sub>COOL</sub> = ACL × 1000 x (1 / SEER <sub>BASE</sub> – 1 / SEER <sub>EE</sub> )
	$\Delta$ kWh <sub>HEAT</sub> = AHL × 1000 x (1 / HSPF <sub>BASE</sub> – 1 / HSPF <sub>EE</sub> )
Definitions	Unit = New ASHP equipment
	CAP <sub>C</sub> = Output cooling capacity of ASHP (kBtu/hr)
	CAP <sub>H</sub> = Output heating capacity of ASHP (kBtu/hr)
	SEER <sub>BASE</sub> = SEER of new code-compliant ASHP (Btu/w-hr) (baseline code updates 6/30/16)
	SEER <sub>EE</sub> = SEER of new high-efficiency ASHP (Btu/w-hr)
	HSPF <sub>BASE</sub> = HSPF of new code-compliant ASHP (Btu/w-hr) (baseline code updates 6/30/16)
	HSPF <sub>EE</sub> = HSPF of new high-efficiency ASHP (Btu/w-hr)
	EER <sub>BASE</sub> = EER of new code-compliant ASHP (Btu/w-hr)
	EER <sub>EE</sub> = EER of new high-efficiency ASHP (Btu/w-hr)
	CF <sub>SP</sub> = Summer peak coincidence factor (%)
	CF <sub>WP</sub> = Winter peak coincidence factor (%)
	AHL = Annual heating load (MMBtu)
	ACL = Annual cooling load (MMBtu)
	1000 = Conversion factor MMBtu to kBtu
EFFICIENCY ASSUMPT	
Baseline Efficiency	The baseline case is a new code-compliant air-source heat pump to provide heating and
	cooling.
Efficient Measure	The high-efficiency case is a new high-efficiency air-source heat pump with a HSPF greater
	than or equal to 10.0 Btu/W-h to provide heating and cooling.

<b>Central Geotherm</b>	al (Ground source) Heat Pump (GCL, GOL, GHP)							
Last Revised Date	4/1/2024							
MEASURE OVERVIE	W							
Description	This measure involves the purchase and installation of new Tier 3 high-efficiency geothermal							
·	heat pump instead of a standard efficiency oil boiler							
Energy Impacts	Electric, Heating Oil							
Sector	Residential							
Program(s)	Home Energy Savings Program							
End-Use	Heating, Cooling							
Decision Type	New Construction, Replace on Burnout							
	ERGY SAVINGS (UNIT SAVINGS)							
Demand savings	$\Delta kW_{C} = -0.084$ $\Delta kW_{SP} = -0.009$							
	$\Delta kW_{H} = -2.931$ $\Delta kW_{WP} = -2.333$							
Annual energy	$\Delta kWh/yr = -7496$							
savings	$\Delta kWh_c/yr = -6$							
	$\Delta kWh_H/yr = -7490$							
	$\Delta$ MMBTU <sub>H</sub> /yr = 109.524							
GROSS ENERGY SAV	INGS ALGORITHMS (UNIT SAVINGS)							
Demand savings	$\Delta kW_{H} = CAP_{H} \times (-1/COP_{EE})/3.412$							
	$\Delta kW_{C} = [\%COOL_{FULL} \times CAP_{C} \times (1/EER_{B} - 1/EER_{E}) + \%COOL_{NONE} \times CAP_{C} \times (-1/EER_{E})]$							
Annual Energy	Heating Savings:							
savings	$\Delta kWh_H/yr = AHL \times 1000 \times (-1/COP_{EE}) / 3.412$							
3441183	$\Delta$ MMBTU <sub>H</sub> /yr = AHL / AFUE <sub>BASE</sub>							
	Cooling Savings:							
	$\Delta kWh_c/yr = ACL \times 1000 \times [\%COOL_{FULL} \times (1/EER_B - 1/EER_E) + \%COOL_{NONE} \times (-1/EER_E)]$							
	Key Assumptions							
	For homes that have the equivalent of whole home A/C already installed, ground source heat							
	pump (GSHP) will replace the cooling load equivalent to the GSHP's rated capacity.							
	For homes that have existing partial cooling (i.e. 1 or 2 existing window A/C units), it is unknown							
	if the GHSP will be used differently than the existing window A/C units. If the GHSP is used to cool							
	the same spaces as existing window A/C units, the GHSP will replace the existing cooling load and							
	result in positive savings due to increased efficiency. However, if the GHSP is used to cool the							
	entire house, it may result in additional cooling load and hence negative savings. Without any insitu data, zero-net savings is assumed for homes with existing partial cooling.							
	<ul> <li>For homes with no existing cooling equipment, it is assumed that the GSHP will be used to its full</li> </ul>							
	cooling capacity.							
Definitions	Unit = New geothermal heat pump system							
	CAP <sub>H</sub> = Output heating capacity of geothermal heat pump at 47°F (kBtu/hr)							
	CAP <sub>C</sub> = Output cooling capacity of geothermal heat pump at 95°F (kBtu/hr)							
	COP <sub>EE</sub> = Coefficient of performance of geothermal heat pump							
	EER <sub>B</sub> = Assumed energy-efficiency ratio for existing cooling equipment (Btu/Watt-hr)							
	EER <sub>E</sub> = Rated energy-efficiency ratio for GSHP (Btu/Watt-hr)							
	%COOL <sub>FULL</sub> = Percentage of homes with existing cooling equipment equivalent of a whole							
	home air conditioner (equivalent of 3 window A/C units) (%)							
	%COOL <sub>NONE</sub> = Percentage of homes with no existing cooling equipment (%)							
	AHL = Annual heating load (MMBtu)							
	ACL = Annual cooling load (MMBtu)							
	1000 = Conversion factor MMBtu to kBtu							
	AFUE <sub>BASE</sub> = Annual fuel utilization efficiency of the existing heating system (%)							

Central Geothermal (Ground source) Heat Pump (GCL, GOL, GHP)

Circulation Pump						1			

<sup>&</sup>lt;sup>452</sup> Brushless permanent magnet motors (BPLMs) are more efficient than permanent split capacitor motors and shaded pole motors because they lack brushes that add friction to the motor, and have the ability to modulate speed to match the required load by sensing the difference between the magnetic field of the rotating rotor and the rotating magnetic field of the windings in the motor stator, and automatically adjusting its speed by altering the frequency to the motor.

	Air Sealing (IR, LIR, MIR)
Air Sealing (IR, LIR, N	
Last Revised Date	7/1/2023
MEASURE OVERVIEW	
Description	This measure involves sealing air leaks in windows, doors, roof, crawl spaces and outside walls
	as well as improved air sealing from insulation resulting in decreased heating and cooling
	loads.
Energy Impacts	Electric, Natural Gas, Oil, Propane, Wood, Kerosene
Sector	Residential
Program(s)	Home Energy Savings Program (HESP), Affordable Heating Initiative (AHI)
End-Use	Heating, Cooling
Decision Type	Retrofit
GROSS ENERGY SAVIN	IGS ALGORITHMS (UNIT SAVINGS)
Demand savings	$\Delta kW_{SP} = \Delta MMBtu_{COOL}$ / EER x 1000 x %COOL x LSF <sub>SP</sub>
	$\Delta kW_{WP} = \Delta MMBtu_{HEAT} / 0.003412 / EFF x LSF_{WP}$
Annual Energy	For known fuel and non-electric heat: $\Delta$ MMBtu <sub>FUEL</sub> = $\Delta$ MMBtu <sub>HEAT</sub> / EFF
savings	$\Delta$ kWh = $\Delta$ MMBtu <sub>COOL</sub> / EER x 1000 x %COOL
	For known electric heat: $\Delta$ kWh = $\Delta$ MMBtu <sub>HEAT</sub> / 0.003412 / EFF + $\Delta$ MMBtu <sub>COOL</sub> / EER x 1000 x
	%COOL
	For unknown fuel: $\Delta$ MMBtu <sub>FUEL</sub> = $\Delta$ MMBtu <sub>HEAT</sub> / EFF x %FUEL
	$\Delta$ kWh = $\Delta$ MMBtu <sub>HEAT</sub> / 0.003412 / EFF x %FUEL + $\Delta$ MMBtu <sub>COOL</sub> / EER x 1000 x %COOL
	$\Delta$ MMBtu <sub>COOL</sub> = $\Delta$ CFM50/14.8 x 60 x 0.014 x CDH / 1000000
	$\Delta$ MMBtu <sub>HEAT</sub> = $\Delta$ CFM50/14.8 x 60 x 0.014 x HDH / 1000000
Definitions	Unit = Air sealing project
20	EFF = Efficiency factor of representative heating system (Btu/Btu)
	EER = Energy-efficiency ratio of representative cooling system (Btu/Wh)
	%FUEL = Home heating fuel distribution <sup>626</sup>
	LSF <sub>SP</sub> = Summer peak load shape factor (kW/kWh/yr)
	LSF <sub>WP</sub> = Winter peak load shape factor (kW/kWh/yr)
	%COOL = Equivalent percentage of homes with full electric cooling equipment (%)
	0.003412 = Conversion factor (MMBtu/kWh)
	1000 = Conversion factor (kW/MW)
	ΔCFM50 = Change in air leakage per square foot of insulation resulting from
	improved air sealing (ft³/h/ft²)
	14.8 = Conversion factor (CFM50 to CFM natural) <sup>627</sup>
	60 = Conversion factor (minutes/hour)
EFFICIENCY ACCURANT	0.014 = heat loss reduction factor from improved air sealing (Btu/(ft³/h)/°F) <sup>628</sup>
EFFICIENCY ASSUMPT	
Baseline Efficiency	The baseline case is the existing home before the air-sealing measures are installed. The
=00.1	program contractor measures the baseline leakage rate (CFM50 <sub>PRE</sub> ) during the home audit.
Efficient Measure	The high-efficiency case is the home after the air-sealing measures are installed. The program
	contractor measures the post-upgrade leakage rate (CFM50 <sub>POST</sub> ) after the air-sealing
	installation is complete.

<sup>626</sup> Heating fuel distribution is used when heating system fuel is unknown.
627 Based on LBNL "N" factors Zone 2, 1.5-2 stories.
628 Btu savings estimated using 0.014 Btu/CFH natural/delta temperature\* delta temperature \* hours per year for each delta temperature as recommended by the West Hill Energy, Efficiency Maine Trust Home Energy Savings Program Impact Evaluation, 2019.

Low Income Air	100% <sup>638</sup>	100% <sup>639</sup>	100% <sup>639</sup>	100% <sup>640</sup>	100% <sup>640</sup>	0% <sup>643</sup>	0% <sup>644</sup>
Sealing						0/0	070

<sup>629</sup> Difference in blower door test results before and after weatherization project (Pre CFM50 – Post CFM50).

<sup>630</sup> Recommended assumption from HESP Impact Evaluation. For known electric heat, 100% efficiency is assumed.

<sup>631</sup> Average existing cooling efficiency is set to the federal standard of 9.8 according to DOE Federal Test Procedure 10 CFR 430, Appendix F: <a href="http://buildingsdatabook.eere.energy.gov/TableView.aspx?table=7.5.1">http://buildingsdatabook.eere.energy.gov/TableView.aspx?table=7.5.1</a>. The code was effective for products manufactured on or after October 1, 2000. Since the measure life for room air-conditioners is about 9 years, most units will meet this standard.

<sup>632</sup> Portland Press Herald, <a href="http://www.pressherald.com/2014/05/26/put power rates on ice that s a cool idea/">http://www.pressherald.com/2014/05/26/put power rates on ice that s a cool idea/</a>. In 2010, an estimated 79 percent of customers in ISO-New England region had room air conditioners. Of the 79 percent, 40 percent of homes have equivalent of whole home A/C (3 window A/Cs); 39 percent of homes have total cooling capacity equivalent of 1 or 2 window A/C units. The remaining 21 percent have no cooling equipment installed. Assuming that the 39 percent of homes with 1 or 2 window units are equivalent to 33% of whole home cooling, the resulting equivalent cooling for all homes is 53 percent (40%\*100% + 39%\*33%).

<sup>633</sup> GDS Measure Life Report, Residential and Commercial/Industrial Lighting and HVAC Measures, Prepared for the New England State Program Working Group, June 2007, Table 1.

 $<sup>^{\</sup>rm 634}$  Electric resistance heat assumed to be 100% efficient.

<sup>635</sup> Derived from whole home heat pump modeling.

<sup>636</sup> Based on temperature bin analysis of seasonal cooling using TMY3 temperature bins and base temperature of 60 deg F.

<sup>637</sup> Based on temperature bin analysis of seasonal heating using TMY3 temperature bins and base temperature of 60 deg F.

<sup>638</sup> ISR is 100 percent because deemed savings results are based on evaluated results that include installation verification.

<sup>&</sup>lt;sup>639</sup> Realization rate set to 100% as savings reflect evaluation results.

<sup>&</sup>lt;sup>640</sup> Peak coincidence factors for this measure are embedded in the evaluated peak demand impacts.

Air Sealing Direct Ins	stall (LNAS) (I	nactive)							, , ,
Last Revised Date	7/1/2019								
MEASURE OVERVIEW									
Description	This measure involves sealing air leaks in windows, doors, roof, crawl spaces and outsid								
	resulting in decreased heating and cooling loads.								
Energy Impacts	Natural Gas								
Sector	Residential								
Program(s)	Low-income Direct Install								
End-Use	Heating, Cooling								
Decision Type	Retrofit								
GROSS ENERGY SAVIN	GS ALGORITHI	MS (UNIT SAV	INGS	5)					
Demand savings	$\Delta kW = 0$								
Annual Energy	ΔMMBtu = HLF x (ΔCFM50) / EFF								
savings									
Definitions	Unit = Air-sealing project								
	HLF = Heat loss factor as a function of reduction in CFM50								
	$\Delta$ CFM50 = Reduction in air infiltration								
	EFF = Efficiency factor of representative heating system (Btu/Btu)								
EFFICIENCY ASSUMPT	1								
Baseline Efficiency	The baseline case is the existing home before the air-sealing measures are installed. The								
	program contractor measures the baseline leakage rate (CFM50 <sub>PRE</sub> ) during the home audit.								
Efficient Measure	The high-efficiency case is the home after the air-sealing measures are installed. The program								
	contractor measures the post-upgrade leakage rate (CFM50 <sub>POST</sub> ) after the air sealing								
	installation is complete.

Insulation (BA, LBA, M	BA, BB, LBB, MBA, BW, LBW, MBW, BU, LBU, MBU)
Last Revised Date	7/1/2023
<b>MEASURE OVERVIEW</b>	
Description	This measure involves the insulation of the attic floor, exterior walls, basement walls or floor exposed to exterior to decrease heating and cooling losses. The participant must also complete a comprehensive air-sealing project. The total savings below reflect savings due to the added insulation and improved air sealing attributable to the insulation.
Energy Impacts	Electric, Oil, Propane, Wood, Kerosene
Sector	Residential
Program(s)	Home Energy Savings Program (HESP), Affordable Heating Initiative (AHI)
End-Use	Heating, Cooling
Decision Type	Retrofit
GROSS ENERGY SAVINGS	S ALGORITHMS (UNIT SAVINGS)
Demand savings	$\Delta kW_{SP} = \Delta MMBtu_{COOL}$ / EER x 1000 x %COOL x LSF <sub>SP</sub>
	For known electric heat: $\Delta kW_{WP} = \Delta MMBtu_{HEAT} / 0.003412 / EFF x LSF_{WP}$
Annual Energy savings	For known fuel and non-electric heat: $\Delta$ MMBtu <sub>FUEL</sub> = $\Delta$ MMBtu <sub>HEAT</sub> / EFF $\Delta$ kWh = $\Delta$ MMBtu <sub>COOL</sub> / EER x 1000 x %COOL
	For electric heat: $\Delta$ kWh = $\Delta$ MMBtu <sub>HEAT</sub> / 0.003412 / EFF + $\Delta$ MMBtu <sub>COOL</sub> / EER x 1000 x %COOL For unknown fuel: $\Delta$ MMBtu <sub>FUEL</sub> = $\Delta$ MMBtu <sub>HEAT</sub> / EFF x %FUEL
	$\Delta$ kWh = $\Delta$ MMBtu <sub>HEAT</sub> / 0.003412 / EFF x %FUEL + $\Delta$ MMBtu <sub>COOL</sub> / EER x 1000 x %COOL Where
	$\Delta$ MMBtu <sub>COOL</sub> = (1/ (RVAL <sub>PRE</sub> + RAdj) – 1/RVAL <sub>POST</sub> ) x SQFT x Aadj x CDH / 1000000 $\Delta$ MMBtu <sub>HEAT</sub> = (1/ (RVAL <sub>PRE</sub> + RAdj) – 1/RVAL <sub>POST</sub> ) x SQFT x Aadj x HDH / 1000000

<sup>654</sup> Recommended assumption from HESP Impact Evaluation. For electric heat, 100% efficiency is assumed.

<sup>655</sup> Average existing cooling efficiency is set to the federal standard of 9.8 according to DOE Federal Test Procedure 10 CFR 430, Appendix F: <a href="http://buildingsdatabook.eere.energy.gov/TableView.aspx?table=7.5.1">http://buildingsdatabook.eere.energy.gov/TableView.aspx?table=7.5.1</a>. The code was effective for products manufactured on or after October 1, 2000. Since the measure life for room air-conditioners is about 9 years, most units will meet this standard.

<sup>656</sup> Based on temperature bin analysis of seasonal cooling using TMY3 temperature bins and base temperature of 60 deg F.

<sup>657</sup> Based on temperature bin analysis of seasonal heating using TMY3 temperature bins and base temperature of 60 deg F.

<sup>658</sup> Portland Press Herald, <a href="http://www.pressherald.com/2014/05/26/put power rates on ice that s a cool idea/">http://www.pressherald.com/2014/05/26/put power rates on ice that s a cool idea/</a>. In 2010, an estimated 79 percent of customers in ISO-New England region had room air conditioners. Of the 79 percent, 40 percent of homes have equivalent of whole home A/C (3 window A/C's); 39 percent of homes have total cooling capacity equivalent of 1 or 2 window A/C units. The remaining 21 percent have no cooling equipment installed. Assuming that the 39 percent of homes with 1 or 2 window units are equivalent to 33% of whole home cooling, the resulting equivalent cooling for all homes is 53 percent (40%\*100% + 39%\*33%).

<sup>659</sup> GDS Measure Life Report, Residential and Commercial/Industrial Lighting and HVAC Measures, Prepared for the New England State Program Working Group, June 2007; Table 1.

<sup>&</sup>lt;sup>660</sup> Claim form requires customer and contractor to confirm insulation installation.

<sup>661</sup> Savings estimates updated based on West Hill Energy, Efficiency Maine Trust Home Energy Savings Program Impact Evaluation, 2019.

<sup>662</sup> Savings estimates updated based on West Hill Energy, Efficiency Maine Trust Home Energy Savings Program Impact Evaluation, 2019.

<sup>&</sup>lt;sup>663</sup> Peak coincidence factors for this measure are embedded in the peak demand impacts formulas.

 $<sup>^{703}</sup>$  The measure has not yet been evaluated. Until the next program impact evaluation, EMT assumes 100% realization rate.

 $<sup>^{704}</sup>$  The measure has not yet been evaluated. Until the next program impact evaluation, EMT assumes 100% realization rate.

<sup>&</sup>lt;sup>705</sup> Program assumes no free ridership for the low-income direct install program.

<sup>&</sup>lt;sup>706</sup> Program not yet evaluated, assume default SO of 0%.

**Appendix A: Glossary** 

Definitions are based primarily on the *Northeast Energy Efficiency Partnerships (NEEP), Regional Evaluation, Measurement & Verification (EMV) Forum, Glossary of Terms, Version 2.0 (PAH Associates, March 2011)*, cited at the end of each definition as [NEEP EMV Glossary].

Adjusted Gross Savings: The change in energy consumption and/or demand that results directly from program-related actions taken by participants in an efficiency program, regardless of why they participated, adjusted for evaluation findings. It adjusts for such factors as data errors, installation and persistence rates and hours of use, but does not adjust for free-ridership or spillover. Adjusted Gross Savings can be calculated as an annual or lifetime value. [NEEP EMV Glossary, edited]

**Actual:** Actual means the project-specific value that is recorded in the Project Application/Documentation for this measure.

**Algorithm:** An equation or set of equations, more broadly a method, used to calculate a number. In this case, it is an estimate of energy use or energy savings tied to operation of a piece of equipment or a system of interacting pieces of equipment. An algorithm may include certain standard numerical assumptions about some relevant quantities, leaving the user to supply other data to calculate the use or savings for the particular measure or equipment. [NEEP EMV Glossary]

**Annual Demand Savings:** The maximum reduction in electric demand in a given year within defined boundaries. The demand reduction is typically the result of the installation of higher efficiency equipment, new controls, or behavioral change. The term can be applied at various levels, from individual projects and energy-efficiency programs to overall program portfolios. [NEEP EMV Glossary, edited]

Annual Energy Savings: The reduction in electricity usage (reported as  $\Delta kWh$ ) or in fossil-fuel use (reported as  $\Delta MMBtu$ ) in a given year from the savings associated with an energy-saving measure, project, or program. [NEEP EMV Glossary, edited]

Average Annual Operating Hours: see Hours of Use.

**Baseline Efficiency:** The assumed efficiency condition of the baseline equipment that is being replaced by the subject energy-efficiency measure. It is used to determine the energy savings obtained by the more efficient measure. [NEEP EMV Glossary, edited]

**Btu:** A standard measure of heat energy, one Btu is required to raise the temperature of one pound of water one degree Fahrenheit from 58.5 to 59.5 degrees under standard pressure of 30 inches of mercury at or near its point of maximum density. [NEEP EMV Glossary, edited]

**Coincident Demand:** The demand of a device, circuit or building that occurs at the same time as the peak demand of a system load or some other peak of interest. The peak of interest should be specified. [NEEP EMV Glossary]

**Coincidence Factor (CF):** The ratio of the average hourly demand of a group of measures during a specified period of time to the sum of their individual maximum demands (or connected loads) within the same period. [NEEP EMV Glossary, edited]

**Deemed Savings:** An estimate of energy or demand savings for a single unit of an installed energy-efficiency measure that (a) has been developed from data sources and analytical methods that are widely considered acceptable for the measure and purpose, and (b) is applicable to the situation being evaluated. A measure with deemed savings will have the same savings per unit. Individual parameters used to calculate savings and/or savings calculation methods can also be deemed. [NEEP EMV Glossary, edited]

**Delta Watts:** The difference in the wattage between existing or baseline equipment and its more efficient replacement or installation at a specific time, expressed in watts or kilowatts. [NEEP EMV Glossary]

**Demand:** The time rate of energy flow. Demand usually refers to the amount of electric energy used by a customer or piece of equipment at a specific time, expressed in kilowatts. [NEEP EMV Glossary]

**ENERGY STAR®:** A joint program of the U.S. Environmental Protection Agency and the U.S. Department of Energy designed to reduce energy use and its impact on the environment. The ENERGY STAR® label is awarded to products that meet applicable energy-efficiency guidelines as well as to homes and commercial buildings that meet specified energy-efficiency standards. [NEEP EMV Glossary, edited]

Free rider: A program participant who would have implemented the program measure or practice in the absence of the program. A free-rider can be: 1) total, in which the participant's activity would have completely replicated the program measure; 2) partial, in which the participant's activity would have partially replicated the program measure; or 3) deferred, in which the participant's activity would have completely replicated the program measure but at a future time beyond the program's timeframe. [NEEP EMV Glossary, edited]

**Free ridership Rate (FR):** The percent of energy savings through an energy-efficiency program attributable to free riders. [NEEP EMV Glossary, edited]

**Gross Savings:** The change in energy consumption and/or demand that results directly from program-related actions taken by participants in an efficiency program, regardless of why they participated and not adjusted for any factors. [NEEP EMV Glossary, edited]

**Hours of Use (HOU) or Operating Hours:** The average number of hours a measure is in use during a specified time period, typically a day or a year. [NEEP EMV Glossary]

**Incremental Cost:** The difference between the cost of existing or baseline equipment/service and the cost of energy-efficient equipment/service. [NEEP EMV Glossary]

**In-Service Rate (ISR):** The percentage of energy-efficiency measures adopted in response to program incentives that are actually installed and operating. The in-service rate is calculated by dividing the number of measures installed and operating by the number of incentives offered by an efficiency program in a defined period of time. [NEEP EMV Glossary, edited]

**Interactive Effects (IE)** - The influence of one technology's application on the energy required to operate another application. An example is the reduced heat in a facility as a result of replacing incandescent lights with CFLs, and the resulting need to increase space heating from another source, usually oil or gas fired. [NEEP EMV Glossary]

**Kilowatt (kW):** A measure of the rate of power used during a preset time period (e.g. minutes, hours, days or months) equal to 1,000 watts. [NEEP EMV Glossary]

**Kilowatt-Hour (kWh):** A common unit of electric energy; one kilowatt-hour is numerically equal to 1,000 watts used for one hour. [NEEP EMV Glossary]

**Lifetime Energy Savings:** The energy savings over the lifetime of an installed measure, calculated by multiplying the measure's annual energy usage reduction by its expected lifetime. [NEEP EMV Glossary, edited]

**Measure Life:** The length of time that a measure is expected to be functional. Measure Life is a function of: (1) equipment life—meaning the number of years that a measure is installed and will operate until failure; and (2) measure persistence which takes into account business turnover, early retirement of installed equipment, and other reasons that

measures might be removed or discontinued. Measure Life is sometimes referred to as expected useful life (EUL). [adapted from NEEP EMV Glossary]

**Meter-level Savings:** Savings from energy-efficiency programs at the customer meter or premise level. [NEEP EMV Glossary, edited]

**Net Present Value (NPV):** Present value of benefits and costs that occur over the life of the measure taking the time value of money into account.

**Net Savings**: The savings attributable to an energy-efficiency program (which differs from gross savings because it includes the effects of free ridership and/or spillover rates).

**Net-to-Gross Ratio (NTGR or NTG):** The ratio of net savings to gross savings. The NTGR may be determined from the free ridership and spillover rates (NTGR=1-FR+SO), if available, or it may be a distinct value relating gross savings to the net effect of the program with no separate specification of FR and SO values. NTGR can be applied separately to either energy or demand savings.

Realization Rate (RR): The ratio of savings adjusted for data errors and for evaluated or verified results (verified) to initial estimates of project savings.  $RR_E$  (Energy Realization Rate) is applied to kWh and all fuels, while  $RR_D$  (Demand Realization Rate) is applied only to kW.

**Seasonal Energy-efficiency Ratio (SEER):** The total cooling output of a central AC unit in Btus (during its normal usage period for cooling) divided by the total electrical energy input in watt-hours during the same period, as determined using specified federal test procedures. [NEEP EMV Glossary]

**Spillover (SO):** Reductions in energy consumption and/or demand caused by the presence of an energy-efficiency program, beyond the program-related gross savings of the participants and without financial or technical assistance from the program. There can be participant and/or non-participant spillover. *Participant spillover* is the additional energy savings that occur when a program participant independently installs energy-efficiency measures or applies energy-saving practices in response to their participation in the efficiency program. *Non-participant spillover* refers to energy savings that occur when someone who did not participate in a program still installs energy-efficiency measures or applies energy savings practices as a result of a program's influence. [NEEP EMV Glossary, edited]

**Spillover Rate (SO):** Estimate of energy savings attributable to spillover effects expressed as a percent of savings installed by participants through an energy-efficiency program. [NEEP EMV Glossary]

**Typical Meteorological Year 3:** The TMY3s are data sets of hourly values of solar radiation and meteorological elements for a 1-year period published by the National Renewable Energy Laboratory. Their intended use is for computer simulations of solar energy conversion systems and building systems to facilitate performance comparisons of different system types, configurations, and locations in the United States and its territories. Because they represent typical rather than extreme conditions, they are not suited for designing systems to meet the worst-case conditions occurring at a location.

**Waste Heat Factor (WHF):** The interaction between a lighting measure's incidental heat output and installed HVAC systems.

**Appendix B: Coincidence and Energy Period Factors** 

Coincidence factors are used to determine the average electric demand savings during the summer and winter on-peak periods as defined by the ISO-NE Forward Capacity Market (FCM). The on-peak demand periods are defined as follows:<sup>707</sup>

- Summer On-Peak: 1:00 to 5:00 PM on non-holiday weekdays in June, July and August.
- Winter On-Peak: 5:00 to 7:00 PM on non-holiday weekdays in December and January.

Energy period factors are used to allocate the annual energy savings into one of the four energy periods. This allocation is performed in order to apply the appropriate avoided cost values in the calculation of program benefits. The four energy periods are defined as follows:<sup>708</sup>

- Winter Peak: 7:00 AM to 11:00 PM on non-holiday weekdays during October through May (8 months).
- Winter Off Peak: 11:00 PM to 7:00 AM on non-holiday weekdays and all hours on weekends and holidays during October through May (8 months).
- Summer Peak: 7:00 AM to 11:00 PM on non-holiday weekdays during June through September (4 months).
- Summer Off Peak: 11:00 PM to 7:00 AM on non-holiday weekdays and all hours on weekends and holidays during June through September (4 months).

Table 8 includes a listing of measure coincidence factors and energy period allocations.

<sup>\*</sup>Cooling only factors apply for insulation and air sealing installed in a non-electrically heated home where only the reductions in cooling load results in electric savings. CF and EPF do not apply to the non-electric fuel savings. AHI factor schedule in effRT assumes cooling only for air sealing, attic insulation and wall insulation as projects are expected to be completed in non-electrically heated homes. Because basement insulation and window inserts have no cooling savings, heating only energy period factors are used in the AHI factor schedule since the only projects that would have electric savings would be for electrically heated homes.

<sup>\*\*</sup>H/C & C Only is a blend of heating and cooling factors and cooling only factors based on the distribution of heating fuel defined in Table 13 for air sealing and insulation. HESP factor schedule in effRT uses the H/C & C Only factors for air sealing, attic insulation and wall insulation measures. Because basement insulation has no cooling savings, heating only energy period factors are used in the HESP factor schedule as electricity savings are for heating only.

<sup>\*\*\*</sup>Coincidence Factor and Energy Period Factors are not applicable for fossil-fuel measures, as avoided costs for fossil fuels do not account for time-of-use.

<sup>&</sup>lt;sup>728</sup> Peak impacts are estimated directly. See deemed demand values.

<sup>729</sup> Data derived from similar jurisdictions. Load Impacts Report, Dunsky Energy and Climate Advisors, 2024.

<sup>&</sup>lt;sup>730</sup> Actual measured performance, dispatches do not occur during winter months.

<sup>731</sup> Demand-only measure.

<sup>&</sup>lt;sup>732</sup> Peak impacts are estimated directly.

<sup>&</sup>lt;sup>733</sup> Demand-only measure.

Lighting savings changed dramatically between 2011 and 2015 as a result of the Energy Independence and Security Act of 2007 (EISA). The following tables outline key assumptions and calculations that changed during that time. This appendix is for historical reference only and is no longer updated.

Table 10. Retail Lighting Program: Baseline Wattages and CFL Wattages

Bulb		Proportion of Total Bulb	Average CFL	Baseline Wattage
Туре	Lumen Bin	Sales	Wattage	(2011)
Standard	3301-4815	0.01%	55.00	200

Average	N/A	100%	14.62	63.71

Table 11 describes the adjustments to baseline starting in 2012 due to the changing maximum wattages specified in EISA.

Table 11. EISA Adjustments by Lumen Range (Evaluation, Table 25)<sup>735</sup>

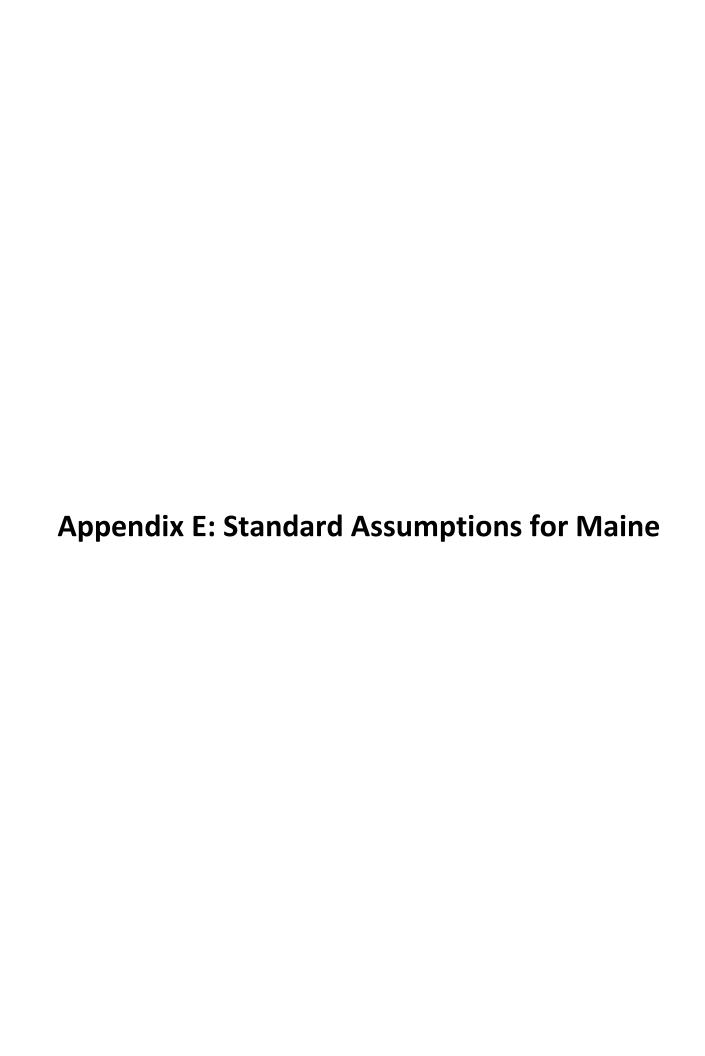

Lumen Range	Assumed Original Baseline	New Maximum Wattage	Effective Date
310-749	40	29	2014
750-1049	60	43	2014
1050-1489	75	53	2013
1490-2600	100	72	2012

Table 12 shows the changes in the weighted average baseline wattage resulting from the EISA requirements becoming effective from 2011 through 2014. Weighted average wattage for CFL and LED bulbs are presented for 2011 and 2014 along with the resulting percentage change in savings compared to 2011 based on EISA impacts.

Table 12. EISA Adjusted Weighted Average Baseline Wattage by Year

Year	Program Year (7/1/(YY-1)- 6/30/YY)	EISA Adjusted Weighted Average Baseline Wattage	Weighted Average CFL Wattage	Delta Watts	Weighted Average LED Wattage	Delta Watts

## **Interactive Effects Derivation**

More efficient lighting provides the same amount of lumens with fewer watts. Halogen and incandescent bulbs generate a lot of heat in addition to light. The wattage that produces heat rather than light is referred to as waste heat. When cooling is called for, the waste heat generated by inefficient lights requires the cooling system to work harder. By replacing inefficient lights with efficient lights less waste heat is produced which reduces the load on the cooling system. The magnitude of the reduced cooling load is proportional to the magnitude of the wattage reduction of the lights. Conversely, when heating is called for, the reduction in waste heat from the replacement of inefficient lights with efficient lights increases the load on the heating system. To calculate the interactive factors several factors must be considered as define below.

Factors included in the calculation of Interactive Effects Factors:

**IGC** = Internal Gain Contribution (%) – This factor accounts for some portion of the wattage reduction not contributing to the interactive effects. Some waste heat escapes through ceiling and wall penetrations without contributing to internal gains that affect the load on HVAC systems.

%A = Applicability (%) – Interactive effects are only applicable if the waste heat reduction interacts with a HVAC system. Lights installed in unconditioned spaces do not contribute to interactive effects. Applicability is calculated as the product of % of bulbs installed in interior sockets and the % of buildings with mechanical cooling. (%A = %I\*%A/C)

**C**<sub>HVAC</sub> = Concurrency with Heating/Cooling – Waste heat only impacts HVAC systems when the lights and the systems are on concurrently. Cooling interactive effects only occur during the cooling season and heating interactive effects only occur during the heating season.

**Eff**<sub>HVAC</sub> = Efficiency of the HVAC system – The change in consumption of the HVAC system is determined by the efficiency of the system.

## **Cooling Demand Interactive Effects Factor**

The following formula is used to calculate the cooling demand interactive effects factor. Total demand reduction is calculated by multiplying the demand reduction from the lighting change by the cooling demand factor. The values used in the formula are defined in the table below.

$$IE_{COOL\_D} = 1 + \frac{IGC \times \%A \times C_{HVAC}}{Eff_{HVAC}}$$

## **Cooling Energy Interactive Effects Factor**

The following formula is used to calculate the cooling energy interactive effects factor. Total energy savings is calculated by multiplying the energy savings from the lighting change by the cooling energy factor. The values used in the formula are defined in the table below.

$$IE_{COOL\_E} = 1 + \frac{IGC \times \%A \times C_{HVAC}}{Eff_{HVAC}}$$

The following formula is used to calculate the heating energy interactive effects factor. Heating energy increased used (in MMBtu) is calculated by multiplying the energy savings from the lighting change (in kWh) by the heating energy factor. The values used in the formula are defined in the table below.

$$IE_{HEAT\_E} = \frac{IGC \times \%A \times C_{HVAC}}{Eff_{HVAC}} \times 0.003412 \; MMBtu/kWh$$

Table 17. Interactive Effects Input Factors and resulting IE Factors

Input Factors		IGC		%A		C <sub>HVAC</sub>		Eff <sub>HVAC</sub>		Interactive Effects Factor

758 Cooling season is assumed to be 5 months for commercial applications due to higher internal gains. (5/12=42%)

<sup>&</sup>lt;sup>749</sup> Based on engineering judgment informed by findings in Chantrasrisalai, C., and D.E. Fisher. 2007. Lighting heat gain parameters: Experimental results. HVAC&R Research 13(2):305-324.

<sup>&</sup>lt;sup>750</sup> Per 2015 Maine Residential Baseline Study, 86% of bulbs are installed in locations that are conditioned. According to Portland Press Herald, <a href="http://www.pressherald.com/2014/05/26/put power rates on ice that s a cool idea /, in 2010">http://www.pressherald.com/2014/05/26/put power rates on ice that s a cool idea /, in 2010</a>, an estimated 79 percent of customers in ISO-New England region had room air conditioners. Of the 79 percent, 40 percent of homes have equivalent of whole home A/C (3 window A/Cs); 39 percent of homes have total cooling capacity equivalent of 1 or 2 window A/C units. The remaining 21percent have no cooling equipment installed. Assuming that a window A/C unit cools 1/3 of a home that works out to be 53% of residential homes are mechanical cooled. (%A = 46% = 86%\*53%)

<sup>751</sup> Maximum demand reduction occurs when lights and cooling systems are on concurrently. Coincidence factors are then applied to determine coincidence with peak hours.

<sup>752</sup> Cooling equipment efficiency is assumed to be 400% based on a SEER of 14 which is the current federal minimum efficiency standard.

 $<sup>^{753}</sup>$  Cooling season is assumed to be 3 months for residential applications. (3/12 = 25%)

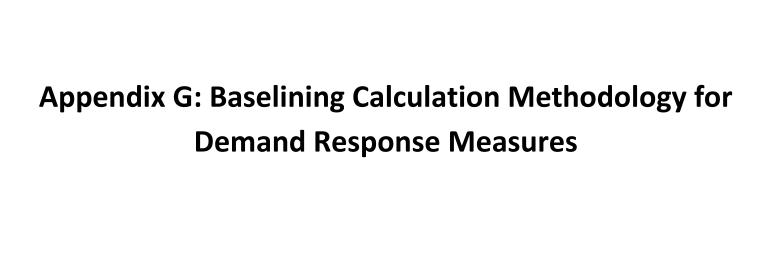

<sup>754</sup> Per 2015 Maine Residential Baseline Study 86% of bulbs are installed in locations that are conditioned. 100% of residences are heated. (%A = 86% = 86%\*100%)

 $<sup>^{755}</sup>$  Heating season is assumed to be 6 months. (6/12=50%)

<sup>756</sup> Per 2015 Maine Residential Baseline Study, the average heating system efficiency is 80.5%. It is assumed that commercial heating systems have a similar average

<sup>&</sup>lt;sup>757</sup> For commercial applications, it is assumed that all bulbs are installed in interior sockets. The C&I Prescriptive program tracks exterior lights separately and interactive effect factors are not applied to those measures. Based on the cooling system type saturation in the 2012 EMT Baseline Opportunities Study and assuming that window unit A/C cools 1/3 of the conditioned space, 77% of commercial space is mechanically cooled in Maine. (%A = 77% = 100%\*53%)

<sup>&</sup>lt;sup>759</sup> For commercial applications, it is assumed that all bulbs are installed in interior sockets. The C&I Prescriptive program tracks exterior lights separately and interactive effect factors are not applied to those measures. It is assumed that 100% of commercial spaces are heated. (%A = 100% = 100%\*100%)

**Table 20: Baselining for Demand Response** 

		DR1 <sup>760</sup>	BEVMCP, PHEVMCP <sup>761</sup>
(1)	Select 10 "like-days" immediately preceding an event, where a "like-day" is a day with similar characteristics to the event day.	Non-holiday weekdays, excluding the following:  Day before event Day-of and day-before from which other demand response events were called by Efficiency Maine or by ISO-NE Days with anomalously low load (less than 25% of average "like-day"	Non-holiday, non-event weekdays
(2)	Of the 10 selected "like-days" from step (1), average the hourly load only for days with the highest load.	Top 5 days with the highest load	Top 5 days with the highest load
(3)	Establish an adjustment period to adjust the hourly averages from step (2) for event-day conditions.	2-hour period occurring 2 to 4 hours prior to event start time	1 hour period occurring 30 to 90 minutes prior to event start time
(4)	Using the load during the adjustment period from step (3), adjust the hourly averages from step (2) to calibrate to event-day conditions.	<ul> <li>(a) During the 5 days selected in step (2), average the load during the 10 (2 hours x 5 days) hours occurring during the same time period from step (3)</li> <li>(b) Average the event-day load during the time period from step (3)</li> <li>(c) Divide (b) by (a)</li> <li>(d) If (c) is greater than 1.2, then use 1.2. If (c) is less than 0.8, use 0.8</li> <li>(e) Multiply (d) by each hourly average load from step (2)</li> </ul>	<ul> <li>(a) Determine hourly load during the time window from step (3) on event day</li> <li>(b) Subtract from the hourly load from (a) by the corresponding average hourly load from step (2)</li> <li>(c) Add (b) to each hourly average from step (2)</li> </ul>
